Although the presence of the larger land area surrounding the property on the north, south, and east sides has been a feature since it was constructed and is a character-defining feature, the setting of the residence as it relates to Bellevue Way SE is not a character-defining feature, given past widening and improvements to Bellevue Way SE. As a result, *Preferred Alternative B2M* would not affect a historic resource related to the existing landscape.

Due to the proximity of the lidded retained cut and light rail guideway to the Winters House, the potential for vibration impacts during operation was analyzed and is described in more detail in Section 4.7, Noise and Vibration. No vibration impacts are projected. Using standard track work, the project would likely have groundborne noise impacts at the Winters House. As described in Section 4.7, Noise and Vibration, standard methods of vibration reduction, such as resilient fasteners or ballast mats, would be incorporated into the project and reduce the level of groundborne noise but may not eliminate the impact. The track design would incorporate a floating slab, if necessary, to eliminate the groundborne noise impact.

Sound Transit applied the Criteria of Adverse Effect (36 CFR 800.5) in analyzing each aspect of *Preferred Alternative B2M*, considering the property's character-defining features that convey its significance and qualify its listing in the NRHP.

Operation of *Preferred Alternative B2M* would not diminish the property's location because the Winters House structure would not be moved. The roadway would be the same distance from the house, and the light rail facility would be in a lidded, retained cut below grade in front of the structure and within the 50-foot property boundary on either side established by the NRHP nomination. Removal of the existing driveway would similarly not diminish the setting of the landscaping because it lacks integrity. Similarly, B3 - 114th Extension Design Option would also avoid adverse impacts on the resource.

Operation of Alternative B1 in the center of Bellevue Way SE is not anticipated to adversely impact the Pilgrim Lutheran Church, which is located just west of the street, although Bellevue Way SE would be realigned up to 10 feet into the property for a distance of roughly 250 feet (Exhibit 4.16-22).

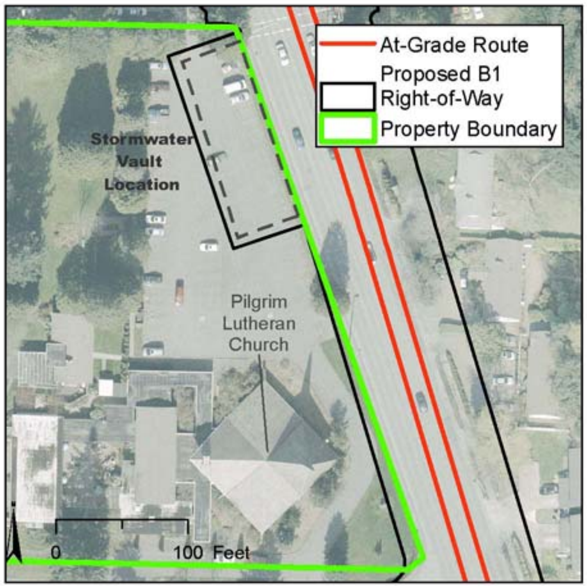

EXHIBIT 4.16-22
Proximity of Alternative B1 to Pilgrim Lutheran Church

In addition, an underground stormwater detention vault would be constructed at the northeast corner of the property in the parking area, but operation of this facility would not adversely impact the Pilgrim Lutheran Church. No parking would be removed. The vault would not be visible after construction, and the only surface element to the vault would be one or two manholes necessary for maintenance. No parking spaces would be removed. Maintenance would consist of periodically parking a truck at the site and opening the manholes for cleaning and maintenance, and maintenance could be scheduled to avoid major events and regular services at the church. The parcel is large and the historic building is sufficiently distant from the portion to be acquired so that the historic property would not be adversely impacted. The location already experiences the visual and noise impacts of heavy street traffic, and no additional impacts are expected to occur from operation of the project. Access from SE 11th Street to the church would not be disrupted. Vibration impacts would not be expected to reach the church.

There are no impacts to historic properties in the Alternative B7 APE. In conclusion, none of the historic buildings in Segment B would be impacted by the project during operations.

Segment C

While *Preferred 108th NE At-Grade Alternative (C11A)* (Exhibit 4.16-23) connecting to *Preferred Alternative B2M* would remove properties along 112th Avenue SE and Main Street, and both streets border the potential Surrey Downs historic district, no properties contributing to the potential historic district would be removed. When connecting to *Preferred Alternative B2M*, *Preferred Alternative C11A* would remove one row of noncontributing properties along 112th Avenue SE, a single row of noncontributing properties along Main Street, and one property along 111th Avenue SE.

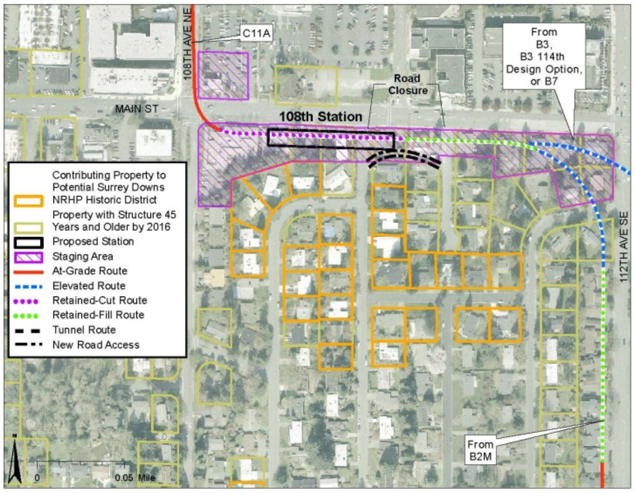

EXHIBIT 4.16-23
Proximity of *Preferred Alternative C11A* to Potential Surrey Downs Historic District

While *Preferred Alternative C11A* would remove properties along 112th Avenue SE and Main Street, it would not remove any of the properties contributing to the potential historic district. Along 112th Avenue SE, the first two rows of properties from the roadway are noncontributing, as are properties nearest the corner of 112th Avenue SE and Main Street and just south of Main Street. Due to the nature and orientation of the properties along the eastern and northern edges of the potential historic district, this impact would not be adverse. One row of noncontributing properties would remain between the contributing properties and the project along 112th Avenue SE and most of Main Street. The contributing properties would be the same distance from 112th Avenue SE and Main Street, and the transit changes to each roadway would not directly affect the district setting that would affect its potential for listing in the NRHP, or for its contributors to convey their significance and that of the district as a whole. The project would not adversely impact the historic setting within the Surrey Downs neighborhood.

Preferred Alternative C11A includes the 108th Station on Main Street adjacent to contributing buildings. Contributing properties nearest the proposed project would be indirectly affected by *Preferred Alternative C11A* operation, and the noncontributing buildings in commercial use along Main Street would be removed. The potential historic district's setting would be affected by the removal of noncontributing properties along the major roadways of 112th Avenue SE and Main Street and the 108th Station. However, due to the surrounding dense, urban nature of the properties along the eastern and northern edges of the potential district, this impact would not be adverse.

When connecting to Alternatives B3, B3 - 114th Extension Design Option, or B7, *Preferred Alternative C11A* would not remove any properties or change access along 112th Ave SE. One row of properties along Main Street would be permanently removed for the light rail guideway and 108th Station.

Preferred Alternative C11A could have potential moderate noise impacts on three contributing properties in the northwest portion of the potential district, south of the proposed station; however, these noise impacts would be minimized and avoided with a permanent sound barrier included along the 112th Avenue SE and Main Street portions of the project.

While *Preferred Alternative C11A* would introduce changes to the setting of the potential Surrey Downs historic district, the project would not affect any contributing properties and would minimize impacts on setting and context. During final design, Sound Transit would assess whether or not the existing large evergreen trees located next to the contributing properties near the 108th Station could be preserved. Sound Transit's intention is to preserve the established trees to the extent practicable. Project components such as station design, landscaping, and a landscaped berm would minimize project visual and noise impacts, create a buffer from the project, and could enhance the neighborhood boundary where noncontributing properties would be removed.

Preferred 110th NE Tunnel Alternative (C9T) would not be adjacent to any contributing properties. It would remove one row of noncontributing properties along 112th Avenue SE and one to two rows of noncontributing properties at the northeast corner of the neighborhood where 112th Avenue SE meets Main Street when connecting to *Preferred Alternative B2M* (Exhibit 4.16-24). Fewer noncontributing properties would be removed along Main Street as compared with *Preferred Alternative C11A* because *Preferred Alternative C9T* enters a tunnel on the south side of Main Street and turns north to tunnel under 110th Avenue NE. The visual change to the area surrounding the potential Surrey Downs historic district would be less than those of *Preferred Alternative C11A* because the properties along Main Street west of 110th Avenue NE would remain. If the East Main Station Design Option is selected, no additional properties would be removed.

EXHIBIT 4.16-24
Proximity of *Preferred Alternative C9T* to Potential Surrey Downs Historic District

When connecting to Alternatives B3, B3 114th Extension Design Option, or B7, *Preferred Alternative C9T* would not remove any properties or change access along 112th Ave SE. One row of noncontributing properties along Main Street between 112th Avenue SE and 110th Avenue would be permanently removed.

While *Preferred Alternative C9T* would affect the setting of the potentially NRHP-eligible Surrey Downs historic district, the project would not affect any contributing properties and would minimize effects on setting and context. Project components such as landscaping create a buffer from the project and could enhance the neighborhood boundary where noncontributing properties would be removed.

There is only one historic property in the Bellevue Way Tunnel Alternative (C1T) APE: the Safeway store. Alternative C1T would be in a tunnel profile in the Bellevue Way street right-of-way when passing by the Safeway property. Alternative C1T would have no visual, vibration, or noise impacts during operation and therefore would not adversely impact this property.

Operation of the 108th NE Tunnel (C3T) and 106th NE Tunnel (C2T) Alternatives would have no visual impacts on properties that contribute to the potential Surrey Downs historic district within the APE (Exhibit 4.16-25). Vibration and noise impacts also are not anticipated during East Link operation. Similar to *Preferred Alternative C11A*, construction would be directly adjacent to contributing properties and appropriate measures to minimize impacts would be implemented.

Operation of Couplet Alternative (C4A) along 112th Avenue SE would avoid adverse impacts on properties that contribute to the potential Surrey Downs historic district (Exhibit 4.16-26). Almost all of the contributing properties would be screened by existing vegetation, fences, and other houses. Similar to *Preferred Alternative C11A*, construction would be directly adjacent to contributing properties and appropriate measures to minimize impacts would be implemented.

The 112th NE Elevated (C7E) and 110th NE Elevated (C8E) Alternatives are not anticipated to affect properties that contribute to the potential Surrey Downs historic district within the APE because the alternatives are distant enough (at least 200 feet) to avoid visual, noise, and vibration impacts.

EXHIBIT 4.16-26
Staging Area for Connections from B2A and B2E vs. B3 and B7 for Alternative C4A

110th NE At-Grade Alternative (C9A) would be elevated and on the east side of 112th Avenue SE, so there would be no acquisition of properties along the west side of 112th Avenue SE near the potential Surrey Downs historic district. Because this alternative would be elevated, with straddle bents, approximately 40 feet in this area, Alternative C9A would result in visual change. In addition, permanent sound walls would be constructed along the south side of Main Street adjacent to noncontributing structures. However, this change in visual quality would occur outside the Surrey Downs neighborhood and therefore not affect its potential eligibility for the NRHP. In addition, the two rows of noncontributing properties along 112th Avenue SE would remain between the potential Surrey Downs historic district and the project. Alternative C9A would travel at-grade on the south side of Main Street before turning north on 110th Avenue NE, and would require the removal of one row of structures along the south side of Main Street between 112th Avenue SE and 110th Avenue NE. None of the properties that would be removed contribute to the potential Surrey Downs historic district, and the project would not be adjacent to any contributing properties.

The intersection of 110th Place SE would either be gated with right-in/right-out access only or closed. However, access to the north end of the neighborhood would remain. Alternative C9A would not alter or remove contributing resources or otherwise diminish character-defining features of the potential historic district.

The 114th Avenue NE Elevated Alternative (C14E) would avoid adverse impacts on properties that contribute to the potential Surrey Downs historic district because the alternative is distant enough to avoid visual change and noise impacts.

Segment D

There are no historic properties within the APE for *Preferred NE 16th At-Grade Alternative (D2A),* Alternative D2A - 120th Station and - NE 24th Design Options, the NE 16th Elevated (D2E), and SR 520 (D5) Alternatives.

For the NE 20th Alternative (D3), a narrow portion of the parcel that the former Bellevue Fire Station occupies would be incorporated into the project due to road reconstruction (Exhibit 4.16-27). However, the building is located on the portion of the parcel outside of the APE, and the portion of the property that would be acquired is not a character-defining feature of the resource. Operation of the alternative would not result in visual, noise, vibration, or other impacts on the property. Widening of the road and introduction of the retained-cut light rail would not adversely impact the setting, which is characterized by major roadways: Bel-Red Road, 148th Avenue NE, and NE 20th Street. Although the building's parcel is situated inside the APE, the building itself is outside the APE.

EXHIBIT 4.16-27
Effects of Alternative D3 on former Bellevue Fire Station

Segment E

The Justice William White House, the Redmond Trading Company building, and the Bill Brown Saloon building (Exhibit 4.16-28) are within the APE of *Preferred Marymoor Alternative (E2)* and Alternative E2 - Redmond Transit Center Station Design Option. The Justice William White House is approximately 65 feet from the route and separated by NE 76th Street. The Bill Brown Saloon is at least 100 feet from the route.

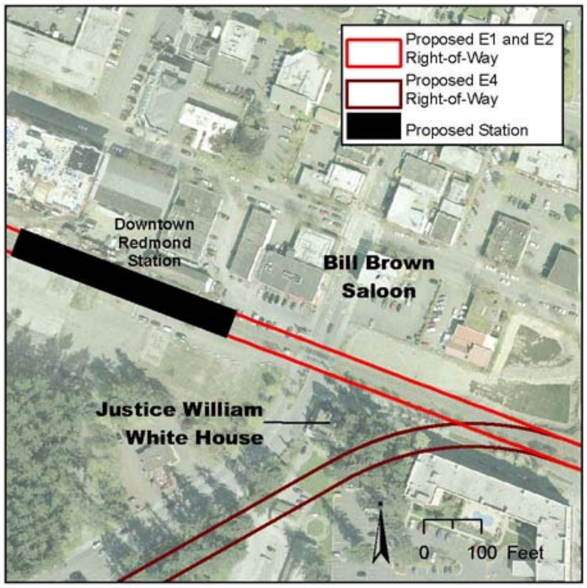

EXHIBIT 4.16-28
Proximity of *Preferred Alternative E2*, and Alternatives E1 and E4 to Bill Brown Saloon Building and Justice William White House

The Redmond Trading Company building is approximately 50 feet from the rail alignment and the Downtown Redmond Station. While *Preferred Alternative E2,* the Downtown Redmond Station, and E2 - Redmond Transit Center Design Option would introduce light rail into the setting of these resources, which are across the former BNSF Railway corridor from each other, including a station just west of Leary Way NE, the project would be at-grade within the existing railroad corridor and consistent with the character of the railroad setting.

The operation of trains for passenger use in the right-of-way is consistent with the historic use of the corridor. The station would be designed in coordination with the City of Redmond and the community to complement the historic setting of Downtown Redmond. In addition, none of the remaining historic period buildings that contribute to the setting would be removed. Therefore, *Preferred Alternative E2* and E2 - Redmond Transit Center Design Option would have no adverse impact on these resources.

During final design, Sound Transit will work with the City of Redmond to adjust the design of *Preferred Alternative E2* within the former BNSF Railway corridor and NE 76th Street right-of-way to accommodate the potential for future freight / commuter rail, the Central Connector utility line, the King County Trail, automobile traffic on NE 76th Street, as well as East Link light rail. Resulting changes may include shifting the *Preferred Alternative E2* rail alignment farther from the Bill Brown Saloon and the Redmond Trading Company building, but closer to the Justice William White House. This shift in the alignment would not affect any of the three properties because *Preferred Alternative E2* would not encroach on the historic boundary, or alter the historic setting of the corridor as a railway in relation to the Justice William White House. The character-defining features of the Justice William White House and the Bill Brown Saloon that convey their significance and qualify the properties for listing in the NRHP would not be adversely impacted by this potential shift of the alignment.

At the Justice William White House, Redmond Trading Company building, and the Bill Brown Saloon building, the Redmond Way Alternative (E1) route is the same as described above for *Preferred Alternative* E2, although it does not include the Downtown Redmond Station. This alternative would result in no impacts on historic properties. The Leary Way Alternative (E4) would require relocating the Justice William White House, which would result in an adverse impact. Sound Transit has consulted with the City of Redmond and DAHP about moving the building to a nearby location that preserves as much of its setting, feeling, and association with the former BNSF Railway as possible to resolve the adverse impacts from building relocation. Furthermore, relocation would occur in a manner that avoids damage to the building during transport and re-establishment. If Alternative E4 is selected, FTA and Sound Transit would continue to consult with the City, DAHP, and other interested parties to determine whether a suitable relocation site can be determined that is feasible within the project alternative. The roles and responsibilities for implementing mitigation measures would be established through a Memorandum of Agreement (MOA). In conclusion, the Justice William White House would be potentially impacted and the remaining historic resources in Segment E would not be impacted by the project during operations.

4.16.3.4 Impacts during Construction

It is unlikely that project alternatives would affect NRHP-eligible archaeological sites because many portions of the project are located within areas not considered sensitive for the occurrence of archaeological sites or are located in high-sensitivity areas that have experienced previous disturbance. In addition, the archaeological investigation to date has encountered no NRHP-eligible archaeological sites, including historically recorded site 45KI8. Past fill and disturbance could have covered, destroyed, or damaged site 45KI8.

Although much of the APE has seen ground disturbance, fill, and development, it is possible that one or more archaeological sites may still exist, deeply buried beneath the ground surface in areas where project excavation would take place. An additional preconstruction survey would be conducted to further identify potential buried resources and would guide the development of an Archaeological Resources Monitoring Plan (ARMP) or an Unanticipated Discovery Plan (UDP). The Segment B and Segment E alternatives have a greater likelihood of containing archaeological sites than the other segments because they are near water bodies that contain resources sought by prehistoric and historic people. *Preferred Alternative B2M,* Alternatives B2A, B2E, B3, and B7 and the B3 - 114th Extension Design Option are near Mercer Slough and its adjacent terraces, while *Preferred Alternative E2* and Alternatives E1 and E4 are near the Sammamish River valley and its adjacent terraces.

The following subsections discuss the potential impacts of project construction on historic buildings and structures. Construction impacts on historic buildings and structures can include temporary loss of access, along with visual impacts, noise, vibration, and the dust and debris of construction activities. Sound Transit would implement minimization and mitigation measures to resolve these potential impacts. For *Preferred Alternatives B2M* and *C11A*, a potential construction impact could occur at the Winters House and potential Surrey Downs historic district. Alternative E4 would potentially impact the Justice William White House as a result of its required relocation.

Segment A

Construction of Segment A and *Preferred Alternative A1* is not anticipated to affect the identified historic properties. The Publix Hotel is located above the transit tunnel, and the INS Building is situated at the east edge of the APE and would not be affected by construction along Fifth Avenue South. The project is also located far enough from the Romaine Electric/Washington Iron Works Pattern Shop that no construction activities are expected to adversely impact the resource. Construction of the at-grade route beneath the 12th Avenue South Bridge also would not adversely impact that property. Project construction would also avoid impacts on the Will H. Thompson House situated above the Mount Baker Ridge Tunnel. Given the distance of construction activities from the resource, the residence at 1402 32nd Avenue South would not be adversely impacted.

Finally, construction would not affect features of the NRHP-eligible I-90 Lake Washington segment, including the portals of the Mount Baker Ridge Tunnels, because the project would be constructed to avoid impacts on the features identified as character-defining by locating all construction activities within the center of I-90, which was originally designed with the intent to allow for such construction. Use of the segment during construction would not affect the property in a manner that would impair future use of the resource as it was intended.

Segment B

The potential for damage from vibration and settlement from construction activity adjacent to the Winters House with *Preferred Alternative B2M*, including construction of underground piles for retained-cut support, may exist. Methods to prevent or limit impacts such as minor cosmetic damage are incorporated as conditions of the project as described in Appendix H4 and Section 4.7, Noise and Vibration. The character-defining features of the NRHP-listed Winters House that convey its significance and qualify the property for listing in the NRHP would not be affected. Construction would introduce visual, audible, and vibration elements that could diminish the character-defining features of the former residence that convey its significance. By employing construction settlement and vibration-minimization measures during construction, the project would minimize damage and alterations to the structure that would affect the design, materials, and workmanship of the resource. Also, if any cosmetic damage occurs, Sound Transit would make the needed repairs consistent with the Secretary of the Interior’s standards.

Construction settlement and vibration minimization measures are described in detail in Appendix H4. Minimization and mitigation measures, which are listed later in this section under Section 4.16.4, Potential Mitigation Measures, would be incorporated into *Preferred Alternative B2M* to resolve potential impacts on the Winters House.

After construction, the landscaping would be restored in a manner sensitive to the historic period. In addition, while the City of Bellevue would not receive rental income from the Winters House during construction, there would be no impacts from the project that would cause a change in the use of the structure or change economic conditions resulting in reduced maintenance of the structure. The public use and the Eastside Heritage Center would be able to return to the building after construction.

With Alternatives B1, B2A, B3, and B3 - 114th Extension Design Option, construction of the at-grade trackway located in the center of Bellevue Way SE would have temporary visual and noise impacts on the Winters House that would not be considered adverse. The character of the setting does not convey or contribute to the significance of the NRHP-listed resource, and, therefore, the temporary change due to construction would not be an adverse impact. Access to the property would be maintained during construction, and the tenant would not need to be relocated. Construction would not alter or damage the building. The same is true for construction of the Alternative B2E route on the west side of Bellevue Way SE across from the Winters House.

Construction of the underground stormwater detention vault at the northeast corner of the Pilgrim Lutheran Church parking lot would have temporary noise impacts on the church and temporarily reduce parking, but these effects would not impair the intended use of the property and are not considered adverse. Sound Transit would avoid construction during church services and special events to the extent possible, and the remainder of the parking area would be available for use.

Alternative B7 would not affect any historic resources during construction.

Segment C

Construction impacts in Segment C would mostly involve connectors from Segment B in the vicinity of the potential Surrey Downs historic district. These issues are outlined below.

Preferred Alternative C11A connecting to *Preferred Alternative B2M* would be constructed and use staging areas along or near Main Street and along 112th Avenue SE (Exhibit 4.16-23). When connecting to Alternatives B3 and B7 and the B3 - 114th Extension Design Option, construction of *Preferred Alternative C11A* would use properties near the corner of Main Street and 112th Avenue SE and one row of properties along Main Street. Construction staging areas are needed before, during, and for a short time after construction work occurs to store and maintain construction equipment and material and fabricate project component. Staging areas might also include contractor trailers (which would act as temporary offices and places for contractors to meet) and construction crew parking.

Construction of *Preferred Alternative C11A* and its staging areas would occur adjacent to and on the edge of the potential Surrey Downs historic district but would not remove properties that contribute to the potential historic district. In most areas, noncontributing buildings would remain between the contributing buildings and project construction except near the intersection of Main Street and 108th Avenue NE, where construction would be adjacent to three contributing buildings. Construction activities could result in noise, visual, and dust impacts on nearby residences. Minimization and avoidance techniques would include installation of a solid construction barrier to shield the homes from construction, and to the extent practical, preservation of the evergreen trees along the south edge of the station area, east of 108th Avenue SE. Construction truck traffic would use the Main Street and 112th Avenue SE arterials without passing through the potential historic district. Street access to the neighborhood might be altered at times, but access would be maintained during construction.

Construction of *Preferred Alternative C11A* along 112th Avenue SE and Main Street is expected to occur largely during daytime working hours. Sound Transit contractors would be required to meet the City’s noise ordinance criteria during all construction and if nighttime or off hours work was required, would seek the appropriate noise variance from the City. Refer to Section 4.7, Noise and Vibration, for additional information.

The *Preferred Alternative C11A* construction impacts would be temporary, lasting about five years overall, with the most intense construction activities (demolition, clearing, and heavy construction) occurring during the first couple years. Construction impact minimization measures included in the project, such as best management practices (such as dust control measures), and a solid construction barrier adjacent to contributing properties would resolve construction impacts. The residences are anticipated to remain habitable during the construction period.

In summary, construction adjacent to the potential historic district would potentially impact the contributing properties without the implementation of appropriate minimization and mitigation measures. Implementing these measures would resolve the potential impacts.

Preferred Alternative C9T would not be adjacent to any contributing properties. It would remove one row of noncontributing properties along 112th Avenue SE and one to two rows of noncontributing properties at the northeast corner of the neighborhood where 112th Avenue SE meets Main Street when connecting to *Preferred Alternative B2M* (Exhibit 4.16-24). Fewer noncontributing properties would be removed along Main Street as compared with *Preferred Alternative C11A* because *Preferred Alternative C9T* enters a tunnel on the south side of Main Street and turns north to tunnel under 110th Avenue NE. The visual change to the area surrounding the potential Surrey Downs historic district would be less than those of *Preferred Alternative C11A* because the properties along Main Street west of 110th Avenue NE would remain. Alterations to neighborhood access would preserve other access points to 112th Avenue SE for the neighborhood.

When connecting to Alternatives B3, B3 - 114th Extension Design Option, or B7, *Preferred Alternative C9T* would not remove any properties or change access along 112th Ave SE. One row of noncontributing properties along Main Street between 112th Avenue SE and 110th Avenue would be permanently removed.

Regardless of the connector, *Preferred Alternative C9T* would not affect any contributing properties in the potential NRHP-eligible Surrey Downs historic district. This alternative would be far enough away from contributing properties to avoid an adverse impact during construction (Exhibit 4.16-24). While construction of *Preferred Alternative C9T* might affect the setting of the potential historic district, these affects would be temporary. Project components such as landscaping, would create a buffer from the project and enhance the neighborhood boundary where noncontributing properties would be removed.

Constructing a tunnel in Bellevue Way for Alternative C1T may require short-term construction easements affecting the sidewalk adjoining the Safeway property, but this would be over 100 feet from the structure, the store is currently closed, and a preliminary land use plan application for new construction is posted on the property. Therefore, there is low potential for indirect effects from East Link during construction. The project includes minimization measures to reduce potential impacts on the Safeway property, as described in Section 4.16.4.

With respect to the potential Surrey Downs historic district, none of the Segment C alternatives would require the removal of property along 112th Avenue SE south of SE First Place adjacent to potential contributing properties.

Alternatives C2T and C3T would involve connectors from Alternatives B2A, B2E, B3, or B7 (Exhibit 4.16-25). The connector from Alternative B2A to C2T or C3T would involve boring beneath the potential Surrey Downs historic district, which would avoid access and visual impacts. Noise and possible vibration could be noticeable to residents during construction but would not affect the buildings. Although the geotechnical analysis shows that the soils in this area are generally resistant to settlement from ground disturbance, precautions during construction and a careful monitoring program would be incorporated into the construction plan.

The connector from Alternative B2E to C2T or C3T would use the northern area of the Surrey Downs subdivision for construction staging at the tunnel portal adjacent to several contributing properties (Exhibit 4.16-25). If connecting from Alternatives B3 or B7, then the staging area would be fewer homes and farther away from contributing residences. Construction would alter access at times during construction and would produce visual, noise, dust, and possible vibration impacts. The impacts would be temporary and would not affect historic structures.

Sound Transit would minimize visual and noise impacts by installing a solid construction barrier adjacent to contributing properties. To meet required noise limits, noise control measures discussed in Section 4.7 would be implemented for Alternatives C2T, C3T, and C4A. The staging area along Main Street created for the Alternative B2E connection to Alternatives C2T or C3T could be developed as a park after construction consistent with the City of Bellevue’s Parks and Recreation Plan or could redevelop consistent with local zoning.

For connectors from Alternatives B2A or B2E to Alternative C4A, construction staging areas would remove one to two rows of properties south of Main Street. Construction would alter access at times during construction and would produce visual, noise, dust, and possible vibration impacts. The impacts would be temporary and not affect historic structures. Sound Transit would minimize visual and noise impacts by installing a solid construction barrier as well as implementing typical best management practices (BMPs) to reduce construction impacts such as dust.

For connectors from Alternatives B3 or B7 to Alternative C4A, construction staging would involve a smaller area but would still be adjacent to portions of the potential Surrey Downs historic district (Exhibit 4.16-26). Construction of connectors to Alternative C4A would be shorter in duration and require less nighttime construction than construction for tunnel alternatives, such as Alternatives C2T and C3T, and *Preferred Alternative C9T*. There would be no effect on the potential Surrey Downs historic district for connectors from Alternatives B3 or B7 to C7E or C8E. Alternative C9A would require similar property acquisition for construction staging as *Preferred Alternative C9T,* with the addition of one building west of 110th Place SE on the south side of Main Street. The elevated and at-grade construction for Alternative C9A is anticipated to have a shorter duration than *Preferred Alternative C11A*, which includes a station on Main Street, and *C9T*, which is a tunnel alternative. Alternative C9A would not impact the potential Surrey Downs historic district.

Alternative C14E is located far enough away from the Surrey Downs subdivision to have no impacts on the resources within it.

Segment D

Preferred Alternative D2A would not affect any historic resources. There are no historic properties within the Alternatives D2A - 120th and - NE 24th Design Options, D2E, or D5 APE.

With Alternative D3, construction in a retained cut near the former Bellevue Fire Station would not affect the property. Although the building's parcel is situated inside the APE, the building itself is outside the APE and would not be adversely impacted by the construction activities proposed. Alternative D3 would not result in any adverse visual, audible, or atmospheric elements that would adversely impact the property or use of the property.

Segment E

Preferred Alternative E2 and E2 - Redmond Transit Center Design Option that continue west and turns north on 161st Avenue NE to Redmond Transit Center would not pass close enough to the Justice William White House, the Redmond Trading Company building, or the Bill Brown Saloon to cause an adverse impact on the historic context or to potentially damage the buildings during construction. *Preferred Alternative E2* would temporarily increase noise and dust and result in visual change from construction activities, but these impacts would not be adverse. In addition, existing vegetation and NE 76th Street, which separate the Justice William White House from the trackway, would further minimize the visual change and dust. Project construction would not adversely impact the character-defining features of the property or use of the historic property. *Preferred Alternative E2* would temporarily increase noise and dust and result in visual change caused by construction activities, but these would not be adverse impacts.

Alternative E1 is in the same location as *Preferred Alternative E2* near the Justice William White House, the Redmond Trading Company building, and Bill Brown Saloon. Therefore, Alternative E1 would have the same temporary noise, dust, and visual impacts on the resource as *Preferred Alternative E2* and would not adversely impact the properties or use of the historic properties.

Alternative E4 would require relocating the Justice William White House, which would cause an adverse impact, as discussed above under Section 4.16.3.3, Impacts during Operations.

4.16.3.5 Maintenance Facilities

There are no historic properties located in the APE for maintenance facilities; therefore, no historic properties would be affected by operation or construction of these facilities.

4.16.4 Potential Mitigation Measures

Given that FTA, in consultation with SHPO, has made a determination of Adverse Effect for the project, an MOA is required pursuant to 36 CFR 800.6[c]. Adverse impacts on historic properties must be resolved through the Section 106 process by preparing an MOA.

An MOA contains stipulations specifying avoidance, minimization, or mitigation measures to be implemented to resolve the potential impacts. A draft MOA, included in Appendix I, addresses potential impacts for the preferred alternative on the Winters House, potential Surrey Downs historic district, and archaeological resources. The proposed measures for these resources are described in this section.

4.16.4.1 Archaeological Sites

Although some potentially sensitive archaeological areas are identified, studies to date have identified no NRHP-eligible prehistoric or historic-period archaeological sites in the project APE.

Although much of the APE has seen ground disturbance, fill, and development, it is possible that one or more archaeological sites may exist beneath the ground surface in areas where project excavation would take place. Project archaeologists would conduct additional subsurface testing before construction— activities referred to as Stage 2 survey— The Stage 2 Survey will provide additional information about the potential for uncovering historic resources for the project.

An archaeological resources monitoring and treatment plan (ARMTP or an Unanticipated Discovery Plan (UDP), would be prepared to guide archaeological monitoring work during East Link Project construction. FTA and Sound Transit would coordinate with SHPO, the Muckleshoot and Snoqualmie Tribes, and other interested parties as appropriate, to review the plan.

In the event that significant archaeological deposits are inadvertently discovered during construction in any portion of the project study area, ground-disturbing activities would be halted and the procedures of the

ARMTP or UDP followed. If ground-disturbing activities encounter human skeletal remains during the course of construction, FTA and Sound Transit would implement relevant procedures in the ARMTP or UDP and follow federal and state laws regarding the discovery of human remains. If the remains are determined to be Indian, FTA and Sound Transit would notify DAHP and the affected Tribes to consult regarding treatment of the remains.

4.16.4.2 Historic Buildings and Structures

The East Link *Preferred Alternative B2M* has the potential to cause an impact on the Winters House. *Preferred Alternative C11A* and Alternatives C4A, C2T, and C3T have the potential to cause an impact on the potential Surrey Downs historic district. The project has the potential to cause an impact on the Justice William White House through Alternative E4.

The following typical BMPs would be incorporated into the project and all resources including the Safeway and the Bellevue Fire Station.

- Take precautions that historic properties are protected from vibrations, excavations, and damage from heavy equipment.
- Protect facades of affected historic buildings from an accumulation of excessive dirt and dust during construction, and/or clean them in an appropriate manner at the conclusion of construction. Sound Transit would consult with the SHPO before implementing any protection or cleaning methods.
- Control fugitive dust using measures listed in Section 4.6, Air Quality.

Resource-specific minimization measures are described below.

Minimization of Operational Impacts on Winters House from *Preferred Alternative B2M*

- Incorporate standard methods of vibration reduction, such as resilient fasteners or ballast mats, into the project as necessary to reduce the level of groundborne noise and eliminate the impact. A floating slab would be incorporated in the project, if necessary, to eliminate the groundborne noise impacts.
- Landscape the area of property between the front (west elevation) of the Winters House and Bellevue Way SE to more closely reflect the landscaping of the historic period, in consultation with the City. Preserve, as practical, historic period plants that would be impacted by the project.
- Provide new interpretive display on or near the Winters House property, in consultation with the City of Bellevue.

Minimization of Construction Impacts on Winters House from *Preferred Alternative B2M*

- Photograph and inventory the building to establish existing conditions.
- Install vibration and settlement monitoring devices and adjust excavation methods based on monitoring results.
- Use specific vibration- and settlement-reducing construction methods (to be determined during final design and construction).
- Potentially build a construction barrier around Winters House to prevent damage and minimize dust.
- Close the Winters House during construction and temporarily relocate the tenant (Sound Transit would provide information to the public regarding how to access the Eastside Heritage Center during construction).
- If damage does occur, make the needed repairs consistent with the U.S. Secretary of the Interior's standards for treating historic properties.

Minimization of Operational Impacts on Pilgrim Lutheran Church from Alternative B1

- Avoid stormwater vault maintenance during church services and special events to the extent possible.
- Minimize parking space obstruction during stormwater vault maintenance.

Minimization of Construction Impacts on Pilgrim Lutheran Church from Alternative B1

- Apply typical BMPs to minimize and avoid construction impact.
- Avoid construction during church services and special events to the extent possible.
- Restore disturbed areas following construction.

Minimization of Operational Impact on NRHP-Eligible Surrey Downs Historic District

From *Preferred Alternative C11A*

- Install a permanent sound barrier along the south side of the guideway along Main Street to prevent noise impacts on contributing properties in the potential Surrey Downs Historic District.
- Landscape along south side of the guideway and the 108th Station along Main Street where noncontributing properties are removed.

From Alternative C4A

- Install a permanent sound barrier along the south side of the guideway along Main Street adjacent to contributing properties.
- Landscape along the south side of the guideway along Main Street to enhance the neighborhood boundary where noncontributing properties are removed.

Minimization of Construction Impact on NRHP-Eligible Surrey Downs Historic District

From *Preferred Alternative C11A* and Alternative C4A

- Apply typical BMPs to minimize and avoid construction impacts.
- Before construction begins, install a solid construction barrier along contributing properties south of Main Street.
- Where possible, preserve the evergreen trees along the south edge of the proposed station area, east of 108th Avenue SE.

From Alternatives C2T and C3T

- Apply typical BMPs to minimize and avoid construction impacts.
- Before construction begins, install a solid construction barrier along contributing properties south of Main Street.

Mitigation Measures for Adverse Impact on Justice William White House from Alternative E4

Consult with SHPO to determine whether an appropriate location can be found to relocate this resource. If such a location can be determined, FTA and Sound Transit would consult with SHPO, the City of Redmond, and other interested parties to develop and to determine a suitable relocation site that preserves the Justice William White House's setting, feeling, and association with the railroad, thus maintaining its eligibility for the NRHP. The relocation would be managed by qualified architects and engineers in a manner to avoid damage to the building and preserve its eligibility for listing in the NRHP. Prior to relocating the building, Sound Transit would fully record the building in its original context through a Level II Historic American Building Survey/Historic American Engineering Record documentation. This would include photographs, measured drawings, and a written history component. If alternative E4 were selected, then the MOA would be altered to include mitigation for the Justice William White House.

4.17 Parkland and Open Space

4.17.1 Introduction to Resources and Regulatory Requirements

The East Link Project study area is situated close to many recreational facilities in communities in Seattle, Mercer Island, Bellevue, and Redmond that vary in size, type, and function. Recreational facilities are discussed in this Final Environmental Impact Statement (EIS) because of their importance to the quality of life of these communities. Federal and local regulations specifically protect parklands. Section 4(f) of the U.S. Department of Transportation (USDOT) Act of 1966 (23 United State Code [U.S.C.] 138) prohibits the Federal Transit Administration (FTA) from approving a project or program that uses land from a significant public park, recreation area, wildlife or waterfowl refuge, or historic site, except if the following conditions are met:

(a) The Administration determines that:
  (1) There is no feasible and prudent avoidance alternative to the use of land from the property; and
  (2) The action includes all possible planning to minimize harm to the property resulting from such use; or
(b) The Administration determines that the use of the property, including any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures) committed to by the applicant will have a *de minimis* impact on the property.
(c) If the analysis concludes that there is no feasible and prudent avoidance alternative, then the Administration may approve only the alternative that causes the least overall harm in light of the statute's preservation purpose (23 Code of Federal Regulations [CFR] 774).

In addition, when federal funds granted through Section 6(f) of the Land and Water Conservation Act (administered through the Washington State Recreation and Conservation Funding Board on behalf of the National Park Service) have been used to acquire or develop recreational facilities in the study area, all practical alternatives to the project element that would affect that facility must be evaluated or, if no practical alternative exists, replacement lands of equal value must be identified. This state funding agency also administers other grants, referred to as "RCO," that are subject to similar requirements for conversion as Section 6(f) without requiring approval from the National Park Service. Appendix D provides more detail on the East Link Project Section 4(f)/6(f) evaluation.

Seattle has adopted a similar test for their parklands under Seattle Ordinance 118477, enacted in February 1997. Land or a facility owned by the city may not be sold, transferred, or changed from park use to another use unless the city receives in exchange land or a facility of equivalent or better size, value, location and usefulness.

4.17.2 Affected Environment

The parkland and open space resources evaluated might include one or more of the following: public parks, greenbelts and other undeveloped open spaces, pedestrian and bicycle trails, playfields, and school district play areas that are available for public use during nonschool hours. Except for school district sites, the facilities in the study area are generally owned or maintained by the parks and recreation departments of Seattle, Mercer Island, Bellevue, Redmond, or King County. The Washington State Department of Transportation (WSDOT) also owns property used for both transportation and recreational purposes in the project vicinity.

The study area for parks and other recreational facilities consists of the facilities situated as follows:

- Within 250 feet (approximately one city block) of alternative routes, maintenance facilities, and staging areas (typically, direct impacts occur within this distance)
- Within 0.25 mile (approximately 1,320 feet) of stations (typically, indirect or proximity impacts occur within this distance—see Section 4.17.3 for a description of types of impacts)

Appendix F4.17 provides an inventory and exhibits that show the location of the 41 park and recreational facilities identified in the study area, including existing and proposed facilities. This inventory groups resources by segment and details each resource's size, type, facilities, ownership, whether or not the facility is considered to be a significant resource under Section 4(f), and whether the Recreation and Conservation Office (RCO) or the Land and Water Conservation Fund (LWCF) were used in acquiring or developing the listed recreational resource. Appendix F4.17 lists notable facilities and planned park development within each segment and includes maps showing the location of each developed park and recreational facility.

Included in the study is the former BNSF Railway corridor. The Port of Seattle has acquired the portion of the former BNSF Railway corridor between the cities of Renton and Snohomish and the Redmond Spur into downtown Redmond. Sound Transit is in the process of acquiring 1.1 miles of the former BNSF Railway corridor from the Port of Seattle in Segment C, as well as an easement along the entire corridor. The City of Redmond purchased the Redmond Spur from the Port of Seattle. The portion of the former BNSF Railway corridor between Woodinville and Renton, including the Redmond Spur, is "rail-banked," Which allows interim trail use of a freight rail right-of-way. King County and the City of Redmond intend to develop a regional trail along portions of the corridor. The rail-banked status of the corridor has been considered in the design of these alternatives. However, small additional property acquisitions might be needed to ensure that adequate space exists so as not to preclude either trail or future freight rail reactivation.

The following subsections briefly describe the recreational facilities located closest to the project alternatives. The parks along the project alternatives were also reviewed for sensitivity to noise, proximity to the alternatives and the alternative's potential for noise impacts. The only parks that are considered noise-sensitive under the FTA regulations are the sections of Mercer Slough Nature Park and Marymoor Park where peace and quiet are an essential part of the parks' purpose. Additional information on noise impacts on park resources is available in the Noise Section 4.7 and Appendix H2, *Noise and Vibration Technical Report*.

4.17.2.1 Segment A

A total of 13 park and open space facilities are situated near and over Segment A from Seattle to Bellevue. All but three of these parks—South Day Street Park; Luther Burbank Park, which includes the Upper Luther Burbank Park area; and Gallagher Hill Open Space—are part of the larger network of Interstate 90 (I-90) parks along lids and overpasses. These parks also include the Outdoor Sculpture Gallery located adjacent to the City of Mercer Island's city center. In addition, a bicycle and pedestrian trail parallels the north side of the I-90 freeway. Although recreationists use this trail, the primary purpose of the shared-use path is transportation (see further discussion in Transportation Chapter 3, Section 3.7 Nonmotorized Facilities).

4.17.2.2 Segment B

There are currently a total of four park and open space facilities in Segment B. The most notable of these is Mercer Slough Nature Park, located between Bellevue Way SE and 118th Avenue SE directly north of I-90. Mercer Slough Nature Park is a 320-acre regional park characterized by wetland systems and upland habitat, the Mercer Slough Blueberry Farm (including fruit and vegetable produce sales), the Environmental Education Center on the east side of the park, the Sweylocken boat launch, and various trails including, the I-90 to Sweylocken Trails, among others; the historic Winters House is also located in the park. The I-90 Trail, continued from Segment A, is located within the park just north of the westbound lanes of I-90.

The park provides wetland habitat, environmental education and awareness, agricultural heritage maintenance, nature observation, views of downtown Bellevue, and open space with pedestrian trails, a water trail, benches, and interpretive signs. Bellevue Way SE is the park's western boundary. Portions of Mercer Slough Nature Park were acquired with LWCF and Washington State RCO funds.

Enatai Beach Park, located under the east approach of the East Channel Bridge between Mercer Island and Bellevue, is located under the project and would not be impacted by the project.

The Bellevue Way Greenbelt is located at the "Y" intersection of Bellevue Way SE and 112th Avenue SE; it primarily serves as a landscaping strip along the road.

A portion of the potential pedestrian/bicycle trail proposed by King County, in the former BNSF Railway corridor acquired through the rail banking process by the Port of Seattle, is in Segment B (as well as portions of Segment C, D, and E). The City of Bellevue's 2009 *Pedestrian and Bicycle Transportation Plan* includes a proposed new trail in Mercer Slough Nature Park.

4.17.2.3 Segment C

Six park and open space facilities currently exist in Segment C, and two more are proposed: a buffer park along Main Street and a trail along the former BNSF Railway. Those closest to the alternatives are briefly described here.

To the south, Surrey Downs Park contains two athletic fields, a play structure, internal trails, open space, remnant stands of heritage filbert trees, the King County District Courthouse, and associated parking. Approximately 8.9 acres of the 11.4-acre site are currently used as park, with the remainder occupied by the King County District Courthouse and parking lots. In March 2009, the City of Bellevue adopted the *Surrey Downs Park Master Plan* for redeveloping the park. Proposed improvements include removing the King County District Courthouse (if not already removed), and adding new baseball fields, open space, a community garden, parking, and a recreational building. A levy to approve funding to implement the master plan was approved by Bellevue voters in fall 2009.

Bellevue's Downtown Park, a 20-acre community park on the south side of NE 4th Street between 100th Avenue NE and Bellevue Way SE, is the centerpiece of the City of Bellevue's park system. Facilities include a play area, formal gardens, water features, and benches.

The NE 2nd Pocket Park comprises the four corners of the intersection of NE 2nd Place and 110th Avenue NE. These small, undeveloped areas function primarily as visual green space as there are no facilities. Bellevue proposes to expand and develop this park under Bellevue's *Downtown Implementation Plan* (City of Bellevue, 2004) and the *Parks and Open Space System Plan* (City of Bellevue, 2010); however, no property has been purchased or plans developed specific to this expansion.

A new linear park in this segment is proposed under Bellevue's *Downtown Implementation Plan*, along the south side of Main Street between 110th and 112th Avenues SE. This park would provide a visual buffer area between the single-family residential area south of Main Street (Surrey Downs) and the high-density residential and commercial uses north of Main Street. No property has been purchased or plans developed specific to the proposed park. Similar to Segment B, the former BNSF Railway east of I-405 is proposed by King County to be converted to a multipurpose recreational trail in Segment C.

McCormick Park is located along the north side of NE 12th Street at the north end of the segment boundary. The park, which extends from 107th to 112th Avenue NE, is a neighborhood park with trails, art features, and picnic benches that provides a buffer between the established single-family residences to the north (Northtowne neighborhood) and high-density residential and commercial uses to the south.

4.17.2.4 Segment D

Highland Park and Community Center is the only existing park resource located in Segment D. Similar to Segments B and C, the former BNSF Railway is proposed by King County to be converted to a multipurpose recreational trail in Segment D.

As part of City of Bellevue's vision as adopted in the *Bel-Red Subarea Plan*, a connected open space system is planned to include trails along urban and natural open space areas, community facilities, community and neighborhood parks, and cultural and arts features.

4.17.2.5 Segment E

Segment E has a total of 14 parks and recreational facilities, including a number of trails. And, as in Segments B, C, and D the former BNSF Railway is proposed by King County to be converted to a multipurpose recreational trail.

The most prominent facilities (e.g., Marymoor Park, Town Center Open Space, and Sammamish River Trail) are located in the downtown area of Redmond and adjacent to State Route (SR) 520. The Town Center Open Space, which includes the Bear Creek Trail, has a City/private agreement (City of Redmond, PARCC, 2010) and was conditionally dedicated as part of the adjacent Redmond Town Center retail area, to preserve and enhance the Bear Creek area, and to provide public access to the area. Future plans would include relocating Bear Creek and Bear Creek Trail, enhancing the habitat within the Bear and Evans Creek open space areas, and linking a new trail to Marymoor Park.

Luke McRedmond Landing provides open space, a picnic shelter, and access to the Sammamish River Trail and Sammamish River for kayakers. Dudley Carter Park is north of Leary Way and is scheduled for master planning and development by the City of Redmond in 2011. Also, Edge Skate Park is located adjacent to the existing Redmond Transit Center, providing a unique recreational opportunity for skateboarders. The Bridle Crest Trail connects Bridle Trails State Park and Marymoor Park via NE 60th Street traveling over SR 520. Also, like Segment A's I-90 Trail, a trail parallels SR 520 on the north side and the primary purpose of the path is transportation. Along Segment E, the King County and City of Redmond plan to eventually connect the former BNSF railway to the East Lake Sammamish Trail to the east. King County is currently expanding the East Lake Sammamish Trail north from 187th Avenue NE to Bear Creek Trail. The *Redmond Trail Network Plan* also identifies the former BNSF Railway corridor for future trail use also called the Redmond Central Connector. In 2009, the City of Redmond acquired rights in the portion of the Redmond Spur to develop a park, regional trail, and subsurface utilities. An approximate 100-foot-wide right-of-way is anticipated to be retained for possible future light rail use (City of Redmond 2010).

4.17.3 Environmental Impacts

Types of potential impacts on parks or open spaces as a result of project operation or construction can be categorized as direct operational impacts, indirect (proximity) operational impacts, or construction impacts, defined as follows:

- **Direct operational impacts**. Direct impacts during operation could include permanently acquiring all or part of park or open space property to accommodate right-of-way for project improvements, changing or reducing access affecting park usage, relocating trails, adding noise impacts to passive park uses, or improving access to parks from stations located near park resources.
- **Indirect (proximity) operational impacts.** Indirect impacts during operation could include changed or reduced access that could affect park usage, changes in the nature of surrounding land uses, increased noise and/or vibration, visual intrusion, or a general increase in the level of activity near stations that could substantially diminish or affect the continued availability, integrity, usage, or value of the specific park or recreational facility and could degrade the overall recreational experience.
- **Construction impacts**. These impacts could include construction activities and/or use of staging areas within or near recreational facilities that create impacts such as noise or air pollution, detours that change access to or from the park, or visual clutter.

Potential impacts were identified for both project operation and construction based on the definitions above and the current use of the park and/or open space resource. If a recreational facility or alternative is not mentioned, no impacts would occur for that facility nor from that alternative. Appendix F4.17 provides a full list of park facilities in the study area. Proximity impacts are based on the findings of other environmental elements, such as Chapter 3, Transportation Environment and Consequences, and Sections 4.2, Land Use; 4.5, Visual and Aesthetic Resources; 4.6, Air Quality and Greenhouse Gases; and 4.7, Noise and Vibration. Information about potential impacts to parks is also presented in Appendix D.

4.17.3.1 No Build Alternative

The No Build Alternative would not directly or indirectly affect any park or open space resources in the study area. Some parkland development might not occur under the No Build Alternative because land would not be made available from property acquisitions for project improvements.

4.17.3.2 Impacts during Operation

As previously mentioned, Section 4.7, Noise and Vibration, and Appendix H2, Noise and Vibration Technical Report, provide additional information on noise effects on park resources.

Segment A, *Preferred Alternative Interstate 90 (A1)*

Two to three of the 13 parks identified in Segment A would be permanently impacted by *Preferred Interstate 90 Alternative (A1)* (listed in Table 4.17-1 and shown in Exhibit 4.17-1). The *Preferred Alternative A1* station entrance for the Rainier Station at 23rd Avenue South would impact a narrow planting strip of Benvenuto Park where the park parallels 23rd Avenue South, but visitors would benefit from increased access to Benvenuto Viewpoint from the Rainier Station. Also, the Mercer Island Station access and pedestrian plazas (i.e., ticket vending, elevator, escalator, and stairs) would impact two planting areas and sidewalks in the open space, owned by WSDOT, at 77th and 80th Avenues SE overcrossings. If the pedestrian bridge option is selected, the access area would impact Mercer Island's Outdoor Sculpture Gallery and 80th Avenue SE for a total impact of 0.4 acre. Roughly 0.3 acre of property would be acquired to accommodate the pedestrian bridge option and pedestrian plaza, thereby allowing a more direct connection to Mercer Island's downtown core. Removing the pedestrian bridge option would reduce the impact area to the open space from about 0.4 acre to less than 0.1 acre.

TABLE 4.17-1
Segment A Parks and Open Spaces Impacts

Alternative	Seattle Benvenuto Viewpoint (part of the I-90 lid) (acres)	Mercer Island Park on the Lid (acres)	Mercer Island Outdoor Sculpture Gallery (acres)
Preferred Interstate 90 Alternative (A1)	Less than 0.1	0.1	0
Interstate 90 Alternative (A1) Design Option	Less than 0.1	0.1	0.3

Segment B

The Segment B alternatives would impact two of the four existing park and open space facilities and one transportation facility. All Segment B alternatives affect the Mercer Slough Nature Park, but none affect the Mercer Slough Water Trails.

Exhibit 4.17-1 **Affected Park Area Within Propsed Right-of-Way Segment A**

East Link Project

The Mercer Slough Nature Park was reviewed for noise sensitivity under the FTA *Transit Noise and Vibration Manual*. Only the interior portions of the park are considered noise sensitive under the FTA criteria and these are located over 350 feet from any project alternative route. These areas were analyzed for noise impacts using existing noise measurements and predicted light rail project noise consistent with FTA criteria. Project noise levels are predicted to be below existing noise levels and well below the FTA noise impact criteria.

Preferred 112th SE Modified Alternative (B2M) would result in the highest permanent property impact to the 320-acre Mercer Slough Nature Park when compared with the other Segment B alternatives; it would not affect the other two parks in Segment B.

When connecting to *Preferred Alternative C11A,* 2.9 acres would be permanently impacted (1.5 acres at-grade and retained cut and 1.4 acres elevated) and 3.0 acres (1.6 acres at-grade and retained cut and 1.4 acres elevated) when connecting to *Preferred Alternative C9T* (Table 4.17-2). Exhibit 4.17-2 depicts the impacted park area. This alternative would acquire an approximately 30- to 50-foot section of the park's western boundary for a distance of approximately 3,200 feet and would remove shrubs and trees. The acquisition area would be less than 1 percent of the total park area.

TABLE 4.17-2
Segment B Parks and Open Spaces Permanent Impacts

Alternative		Mercer Slough Nature Park (acres)	Bellevue Way Greenbelt (acres)
Preferred 112th SE Modified Alternative (B2M)	To *Preferred Alternative C11A*	2.9	None
	To *Preferred Alternative C9T*	3.0	
Bellevue Way Alternative (B1)		0.5	0.4 (full acquisition)
112th SE At-Grade Alternative (B2A)		1.7	0.1
112th SE Elevated Alternative (B2E)		0.7	None
112th SE Bypass Alternative (B3)		1.7	0.1
B3 - 114th Extension Design Option		1.7	0.1
BNSF Alternative (B7)		0.9	None

The area affected includes trailheads and access associated with a boat launch ramp, the blueberry farm, and the National Registry of Historic Places (NRHP)-listed Winters House. Park users in this area include walkers and joggers along the Periphery Loop Trail sidewalk and those accessing the Winters House and Mercer Slough Blueberry Farm and the park's interior trails. A 0.2-mile section of the Heritage Loop Trail parallels Bellevue Way SE below the roadway level. The impacted area is not a key location for wildlife viewing due to the disturbance of the adjacent roadway and use of the area for the Winters House, blueberry farm buildings, parking, and access.

Preferred Alternative B2M would relocate and consolidate some vehicle and pedestrian access points on the west side of the park. Additionally, the existing blueberry farm vehicle and pedestrian access would be relocated to the north to a joint access with the Winters House. A new access road just to the east of and parallel to the alternative would connect the blueberry farm and the Winters House parking areas, with the existing Heritage Loop trail between the Winters House and farm relocated to the east. Two existing pedestrian connections from Bellevue Way SE to the park would be removed: one at the existing blueberry farm driveway and one south of the Winters House parking lot. The pedestrian access north of the Winters House would be relocated slightly south. The light rail station at the South Bellevue Park-and-Ride would provide enhanced accessibility to the Mercer Slough Nature Park.

At the south end of the park, where the alternative is elevated, the area below the elevated section, (approximately 1.4 acres), could still be available for recreational purposes in those areas where there is sufficient clearance. The elevated guideway would require an easement or right of use as opposed to acquisition. The easement would allow the project on the property and give rights for Sound Transit to access the elevated structure, as needed, while allowing the continued use of the land as a park.

Although the number of pedestrian access points would be reduced by two, the park and its components would remain accessible from various points along Bellevue Way SE for both vehicles and pedestrians. In addition, consolidating the access points could be considered a benefit to the park by removing one vehicular driveway crossing the Periphery Loop Trail.

Access to the Sweylocken Boat Ramp would become right-in/right-out only and the boat ramp would no longer be accessible from southbound Bellevue Way; however, there is a design option that would maintain the current access allowing left-hand turn movements to the boat launch.

Exhibit 4.17-2. **Affected Park Area, Segment B**
East Link Project

Without the design option, southbound users would need to travel via SE 8th Street, I-405, and I-90 to access the launch. The I-90 Trail would not be affected.

As detailed in the Section 4.5, Visual and Aesthetic Resources analysis, *Preferred Alternative B2M* would result in visual change but would not degrade the visual quality of the park. The guideway, catenaries, and retaining walls would not be seen in most parts of the Mercer Slough Nature Park due the alternative's low profile. Given the presence of trees and large shrubs throughout the park, removing vegetation along the alternative would not be noticed in most areas from the park. Changes in views from the southern end of the water trail would be consistent with surrounding freeway ramps and structures. The visual change associated with tree removal would be most noticed from the portion of the water trail passing through Mercer Slough West adjacent to the Bellefield Office Park. However, Bellefield Office Park buildings and parking lot and the adjacent transportation arterial currently affect the area's visual quality in this area.

Preferred Alternative B2M would not substantially affect the park's use, features, activities, and attributes nor diminish the park's value. The SE 8th Station for *Preferred Alternative B2M* when connecting to *Preferred Alternative C9T* would also provide enhanced access to the Surrey Downs Park. Portions of Mercer Slough Nature Park were acquired with federal LWCF and Washington State RCO funds. Appendix D, Section 4(f)/Section 6(f) Evaluation, analyzes Section 6(f) and RCO conversion and acreage impact.

The park impacts for all Segment B alternatives are identified in Table 4.17-2 and discussed in more detail below. Similar to *Preferred Alternative B2M*, Bellevue Way (B1), 112th SE At-Grade (B2A), 112th SE Elevated (B2E), 112th SE Bypass (B3), and B3 - 114th Extension Design Option Alternatives would provide enhanced accessibility to the Mercer Slough Nature Park. They also would acquire long, narrow and intermittent portions of this park's western boundary—thereby removing some shrubs and trees—although less area would be acquired compared to *Preferred Alternative B2M*. Exhibit 4.17-2 shows the impacted areas of these parks. Alternatives B2A, B2E, B3, and B3 - 114th Extension Design Option would relocate a portion of the Heritage Farm Trail just east of its current location, between the South Bellevue Park-and-Ride and the Winters House. Alternative B2A would permanently impact 1.7 acres within Mercer Slough Nature Park (0.4 acres at-grade and 1.3 acres elevated), Alternative B2E would permanently impact 0.7 acre (all of it elevated), and Alternative B3 and B3 -114th Extension Design Option would impact 1.7 acre (0.4 acres at-grade and 1.3 acres elevated).

Access to the Sweylocken Boat Ramp from SE 30th Street would be improved under Alternative B1 because a signal would be installed at this intersection where none exists today. Alternatives B2A, B2E, B3, and B3 – 114th Extension Design Option would be elevated at this location, and access to the boat ramp would be right-in/right-out only as with *Preferred Alternative B2M.* The design option to maintain the current access could also be implemented with these alternatives. The I-90 Trail would not be impacted by these alternatives. The elevated structure with all alternatives would create some additional shading. As with the *Preferred Alternative B2M*, the areas below the elevated section, ranging from a low of approximately 0.7 acre for Alternative B2E to a high of approximately 1.4 acres for Alternative B2A, could still be available for recreational purposes. Removing vegetation along Bellevue Way SE and/or placing piers for the elevated portions of the alternatives along the west side of Mercer Slough Nature Park would be seen and noticed by some park users but would not interfere with the use of the facility.

Beyond Mercer Slough, Alternative B1 would permanently impact 0.4 acre, all of it at-grade, and would also completely acquire the Bellevue Way Greenbelt, while Alternatives B2A, B3 and B3 – 114th Extension Design Option would only partially acquire this area (0.1 acre at-grade) to accommodate the reconfigured Bellevue Way SE/112th Avenue NE intersection. Similar to *Preferred Alternative B2M* when connecting to *Preferred Alternative C9T*, the SE 8th Station for Alternatives B2A and B2E would provide enhanced access to Surrey Downs Park.

The elevated light rail structure for Alternative B7 would be located along the south side of Mercer Slough Nature Park north of I-90 and the I-90 Trail (see Exhibit 4.17-2). An easement would be needed to accommodate the elevated light rail structure. The area under the elevated structure would be revegetated and returned to existing conditions. The I-90 Trail would not be impacted. As described in Section 4.5, Visual and Aesthetic Resources, the view from the park and trail would not be substantially affected by the new structure. Existing vegetation greatly reduces the amount of Mercer Slough Nature Park that can be seen from most parts of the I-90 trail and blocks views to the north. The elevated structure would be seen from a few more open parts of the trail but would be screened by adjacent vegetation along other parts of the trail. The elevated structure would also create shading in the park. The portion of the

Alternative B7 located within the former BNSF Railway corridor has been designed to accommodate a future trail, to be developed by others. Alternative B7's 118th Station would provide new access to the east side of Mercer Slough Nature Park and the Mercer Slough Environmental Education Center.

Segment C

Three of the eight existing parks and open space facilities identified in Segment C would be permanently impacted by the alternatives. The locations of impacted parks are shown in Exhibit 4.17-3 and listed in Table 4.17-3; enlarged illustrations of the park impact areas follow.

TABLE 4.17-3
Segment C Parks and Open Spaces Permanent Impacts

Impact Area	Surrey Downs[a] (acres)	Pocket Parks (acres)	McCormick Park	
			Impact Area (acres)	New Parkland[b]
Preferred Alternative C11A	0.5	None	None	None
Preferred Alternative C9T[c]	0.5	0.1	None	None
Alternative C2T	Less than 0.1	None	None	None
Alternative C3T	Less than 0.1	None	0.9	1.6 (0.7)
Alternative C4A	0.5	0.1	0.8	1.1 (0.2)
Alternative C7E	0.4	None	None	None
Alternative C8E	None	0.1	0.2	0.4 (0.1)
Alternative C9A	None	Less than 0.1	None	None

[a] Only for connector from *Preferred Alternative B2M* for *Preferred Alternatives C11A* and *C9T* and from Alternative B2A for Alternatives C2T, C3T, C4A, and C7E.

[b] Provided in acres (net gain).

[c] C9T – East Main Station Design Option when connecting from *Preferred Alternative B2M* would have no change in impacts from those of *Preferred Alternative C9T* or *B2M*.

Preferred Alternative C11A with a connection from *Preferred Alternative B2M* would impact 0.5 acre of Surrey Downs Park due to the guideway's location along the eastern boundary of the park. Connections to *Preferred Alternative C11A* from Alternative B3, B3 - 114th Extension Design Option, or B7 would not affect Surrey Downs Park. The area of the park that would be affected by the project is characterized by a steep slope and trees along 112th Avenue SE, vehicle access from 112th Avenue SE at the southern and northern ends of the park, a parking lot for the park and King County District Courthouse building, a neighborhood pedestrian access point at the southeast corner of the park at 111th Avenue SE, and a pedestrian access point from 112th Avenue SE at the northeast corner of the park.

Preferred Alternative C11A would acquire approximately 0.5 acre along the eastern edge of Surrey Downs Park along 112th Avenue SE for the light rail guideway (Exhibit 4.17-4); no active recreation facilities would be affected. The at-grade light rail guideway would encroach along the park's eastern edge, displacing the landscaping strip and large trees. In addition, the project would displace some of the parking area that is used for the park and the King County District Courthouse. The existing vehicle access at the southern end of the park changes to right-in/ right-out. The pedestrian connections on the east side of the park would not be affected on the south side. The vehicle access point at the north end of the park would be closed. Design improvements to the south driveway would minimize impacts associated with removing the north driveway. U-turn movements would be provided at nearby intersections, at SE 6th or Main Street and SE 8th Streets, to minimize out of the way travel for vehicles that access the park north along 112th Avenue SE. Removing vegetation and large trees would be a visual change, but the vegetation would be replaced and eventually mature without lowering the visual quality of the area. The light rail guideway would be consistent with the transportation nature of the 112th Avenue SE corridor.

Preferred Alternative C11A is not consistent with the *Surrey Downs Park Master Plan* adopted by the Bellevue City Council in March 2009. The light rail guideway would encroach into the planned garden terraces and path bordering 112th Avenue SE and would be adjacent to the area planned for the community facility. The alternative would require relocating or eliminating the proposed pedestrian access points from 112th Avenue SE at the park's northeast corner. As part of the project, properties located to the west of 112th Ave SE between Main Street and Surrey Downs Park would be acquired. Once the project is built and operational, a substantial amount of the acquired area will be available and could be developed into an open space linear park. This new linear park would mitigate the impacted area in Surrey Downs Park, which is primarily passive open space.

Preferred Alternative C11A and the Hospital Station would be located in the former BNSF Railway corridor right-of-way. The station and alignment are designed to incorporate a planned trail or future freight use, which would be developed by others.

Exhibit 4.17-3
Segment C
Affected Parks
East Link Project

With the connection from *Preferred Alternative B2M, Preferred Alternative C9T* would permanently acquire approximately 0.5 acre of Surrey Downs Park along its northeast boundary along 112th Avenue SE for the at-grade light rail guideway and to realign SE 4th Street to create a four-way intersection with SE 6th Street and 112th Avenue SE and new park vehicle entrance (see Exhibit 4.17-5). The affected areas would be similar to the areas affected by *Preferred Alternative C11A* but would also include removing a portion of the King County District Courthouse building (if not already removed) and a pedestrian access point from 112th Avenue SE at the northeast corner of the park. As part of the project, properties located to the west of 112th Avenue SE between Main Street and Surrey Downs Park would be acquired. Once the project is built and operational, a substantial amount of the acquired area will be available and could be developed into an open space linear park. This new linear park would mitigate the impacted area in Surrey Downs Park, which is primarily passive open space.

Preferred Alternative C9T would not impact the park south of SE 6th Street because the light rail guideway remains on the east side of 112th Avenue SE in this location. No active recreation facilities would be affected. Realigning SE 4th Street would permanently use park property for the roadway and separate a small section currently occupied by the King County District Courthouse and parking from the remainder of the park. The curved design of the realigned roadway would reduce cut-through traffic and maintain the slow vehicle movements through the park. A second option would provide a new connection into the Surrey Downs neighborhood at SE 9th Street from the south park entrance. Access to the neighborhood from the south park entrance would permanently close the north entrance, thereby reducing park impacts, but it would result in changing circulation patterns in the neighborhood.

Preferred Alternative C9T is not consistent with the *Surrey Downs Park Master Plan* adopted by the Bellevue City Council in March 2009. The project would result in similar impacts as *Preferred Alternative C11A* at the park's northeastern side, including the light rail encroaching into the planned garden terraces and path bordering 112th Avenue SE. In addition, realigning SE 4th Street would further encroach into a portion of the area planned for the community facility. This alternative would relocate or eliminate one of the two proposed pedestrian access points, with the access point at SE 6th Street combined with the realigned SE 4th Street access to the park.

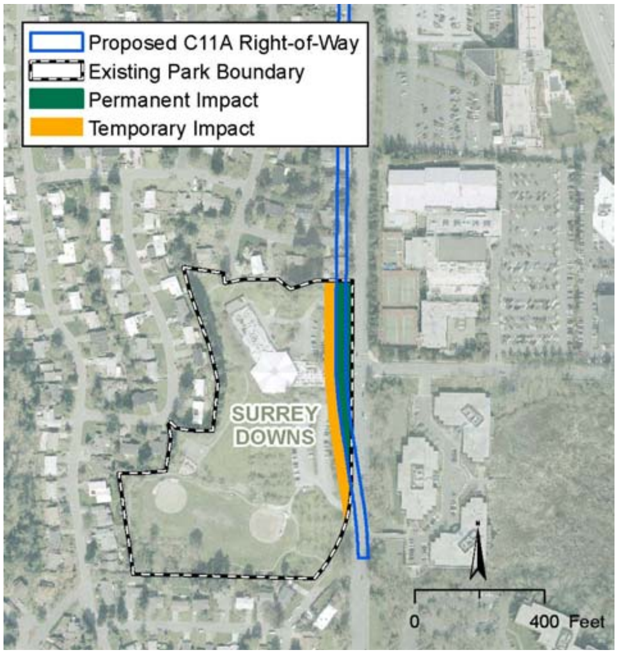

EXHIBIT 4.17-4
Surrey Downs Park Impacts for *Preferred Alternative C11A*

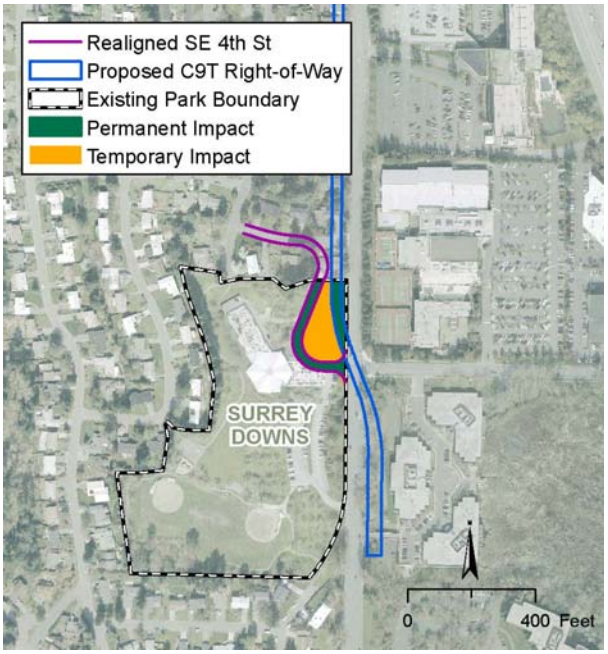

EXHIBIT4.17-5
Surrey Downs Park Impacts for *Preferred Alternative C9T*

Preferred Alternative C9T would impact the NE 2nd Street Pocket Park located at NE 2nd Street and 110th Avenue NE during project operation (Exhibit 4.17-6). The northwest quadrant of the park, approximately 0.1 acre, would be incorporated into a station entrance and developed as an outdoor public plaza. A tunnel easement would be acquired under the park's northeast and southeast quadrants, and the area above the tunnel would be returned to park use after construction. Additionally, a portion of the area used for staging adjacent to the northeast quadrant could be used to replace parkland. Similar to *Preferred Alternative C11A, Preferred Alternative C9T* would accommodate a trail in the former BNSF Railway corridor as part of the Hospital Station, which would be developed by others.

106th NE Tunnel (C2T) and 110th NE Tunnel (C3T) Alternatives would have similar impacts on parks, (0.1 acre of tunnel) except Alternative C3T would affect one more park than Alternative C2T; Alternative C3T would also impact McCormick Park (0.1 acre elevated, 0.5 acre of retained cut, and 0.4 acre of tunnel). There would be no adverse impacts from connections from Segment B to Alternative C2T, except for the connection from Alternative B2A, which would tunnel under Surrey Downs Park, requiring a subsurface easement. However, no portion of the project or tunnel would be visible on the park surface after construction. This connector would require roadway widening that would affect less than 0.1 acre of the eastern edge of the park on the landscape strip between 112th Avenue SE and the park's existing parking lot, as illustrated in Exhibit 4.17-7. This would not affect active recreational areas of the park.

With Alternatives C2T and C3T, the Alternative B2A connection would have a net benefit to Surrey Downs Park by removing the King County District Courthouse—if not already removed at the time of East Link construction—and would help facilitate implementing the City of Bellevue's *Surrey Downs Master Plan* to redevelop the park facility. However, depending on the park development schedule, construction staging at this location might delay implementing the park plan. Sound Transit would coordinate with the City of Bellevue on revising the master plan if this alternative were to be selected. Alternative C2T would accommodate the trail in the former BNSF Railway as part of the Hospital Station, to be developed by others. Under Alternative C3T (108th NE Tunnel), the eastern portion of McCormick Park would include the tunnel portal and the rising guideway transitioning to an elevated structure (Exhibit 4.17-8). This transition would require a retaining wall roughly 550 feet long to support the light rail structure as it transitions from a tunnel to aboveground profile. This structure would alter access from NE 12th Street into the park. In addition, the structure would result in different user experience than exists today. The permanent structure would remove 0.9 acre from park use and restrict access between portions of the park.

Exhibit 4.17-8 **McCormick Park - Proposed Right-of-Way and Staging Areas Segment C**
East Link Project

The tunnel would extend west of the portal under the park, which would require a subsurface easement but could be used as a park on the surface. When the facility is constructed, the area used for construction staging (Exhibit 4.17-8) and the area above the tunnel from roughly 108th to 110th Avenue NE would be used to recreate and expand the parkland, resulting in an overall increase of the park size by 0.7 acre. This alternative would have the greatest parkland net gain (see Section 4.17.3.3, Impacts During Construction, for more details). The new park vegetation would take several years to mature, and until the vegetation reestablishes, a temporary change in visual quality for park users would result, and the park's ability to function as a buffer from adjacent uses would be temporarily reduced.

For Alternative C4A, only the Alternative B2A connection would impact Surrey Downs Park. Alternative C4A would impact 0.5 acre of the park, all of it elevated. Similar to *Preferred Alternative C11A,* Alternative B2A connection to Alternative C4A would remove about 0.5 acre of Surrey Downs Park in the landscape strip between 112th Avenue SE and the park's existing parking lot (illustrated in Exhibit 4.17-7). This would not affect the park's active recreational areas. Sound Transit would coordinate with the City of Bellevue revising the master plan for Surrey Downs Park if Alternatives B2A and C4A were to be constructed.

Alternative C4A would require minor property acquisition of 0.1 acre in the NE 2nd Pocket Parks east and west of 110th Avenue NE to widen the road to accommodate the at-grade light rail route (see Exhibit 4.17-9). Because the pocket parks contains no recreational facilities and serves principally as open space, the park would likely continue to operate as it does currently.

At McCormick Park, the guideway is at-grade (0.6 acre of impact) between 108th and 110th Avenues NE and then transitions to an elevated structure (0.2 acre of impact) over 112th Avenue NE.

This transition would require a retaining wall to support the light rail structure as it rises from an at-grade to elevated profile. This structure would alter access from NE 12th Street into the park. Additionally, the structure would result in different user experience than exists today. Alternative C4A would remove 0.5 acre from park use and restrict access between portions of the park. Approximately 0.3 acre would be located beneath the elevated guideway, but there would not be a surface impact, and areas beneath the elevated guideway could still be available for recreational purposes.

When the facility is constructed, the area used for construction staging (Exhibit 4.17-8) could be used to recreate and expand the parkland, resulting in an overall increase of the park size by 0.2 acre. See Section 4.17.3.3, Impacts during Construction, for more details. The new park vegetation would take several years to mature, and until the vegetation is reestablished, a temporary change in visual quality for park users would result, and the park's ability to function as a buffer from adjacent uses would be temporarily reduced.

Impacts to Surrey Downs Park for Alternative C7E would be the same as for Alternative C4A, and only the Alternative B2A connector would have park impacts because it would require roadway widening, which would remove about 0.4 acre of Surrey Downs Park in the landscape strip between 112th Avenue SE and the park's existing parking lot, as illustrated in Exhibit 4.17-9.

NE 2ND ST
110TH AVE NE
111TH AVE NE

Exhibit 4.17-9
Alternative C4A and C8E Pocket Park Impact Area

The 0.4-acre impact would be elevated; this would not affect active recreational areas of the park. Sound Transit would coordinate with the City of Bellevue on developing the master plan for Surrey Downs Park if this alternative is selected. Although the elevated light rail structure would be seen from the eastern corner of McCormick Park, no impacts on the park or its users are expected.

Alternative C8E would pass over 0.1 acre of the pocket park at the northeast corner of 110th Avenue NE and NE 2nd Place, resulting in shading of the pocket park, a visual intrusion, and a new easement. Because this park contains no recreational facilities, however, and serves principally as open space, it is expected that the park could continue to operate as it does currently (see Exhibit 4.17-9).

The elevated light rail structure of Alternative C8E would be seen from the Library Plaza, but because it would be located in the median of 110th Avenue NE, no direct impacts on the plaza would occur. In McCormick Park, the elevated light rail structure crosses NE 12th Street over the northern edge of the park between 111th and 112th Avenues NE, covering 0.2 acre. Because the light rail structure would be elevated approximately 30 feet above the park in this area, the structure would become a dominant and noticeable feature, which would affect the visual environment for some park users and create shade. However, park users could still move freely to and from other portions of the park under the light rail structure, so it would not impact access as the Alternatives C3T and C4A would.

As with Alternatives C3T and C4A, when construction is complete for Alternative C8E, the area used for construction staging in McCormick Park (see Exhibit 4.17-8) would be used to create new parkland, and the park would, thus, slightly increase in size. Similar to Alternatives C3T and C4A, the new park vegetation would take several years to mature, and until the vegetation is reestablished, a temporary change in visual quality for park users would occur as well as a temporary reduction in the park's ability to function as a buffer from adjacent uses.

Similar to *Preferred Alternatives C11A* and *C9T* and Alternatives C2T, C3T, and C4A, Alternative C9A might help facilitate Bellevue's goal to develop an open space area along Main Street to buffer residential uses to the south. Alternative C9A would permanently acquire less than 0.1 acre of the western edge of the Pocket Park quadrants on the east side of 110th Avenue NE (Exhibit 4.17-10). Due to the area's existing transportation character, no visual impacts would be anticipated. Alternative C9A would not impact Surrey Downs Park functions and uses, but the elevated structure would impact less than 0.1 acre of McCormick Park. Similar to *Preferred Alternative C11A*, Alternative C9A would accommodate the trail in the former BNSF Railway as part of the Hospital Station, to be developed by others. Although Alternatives C1T and C14E would have no impacts on existing parks, they would accommodate the trail in the former BNSF Railway as part of the Hospital Station, to be developed by others.

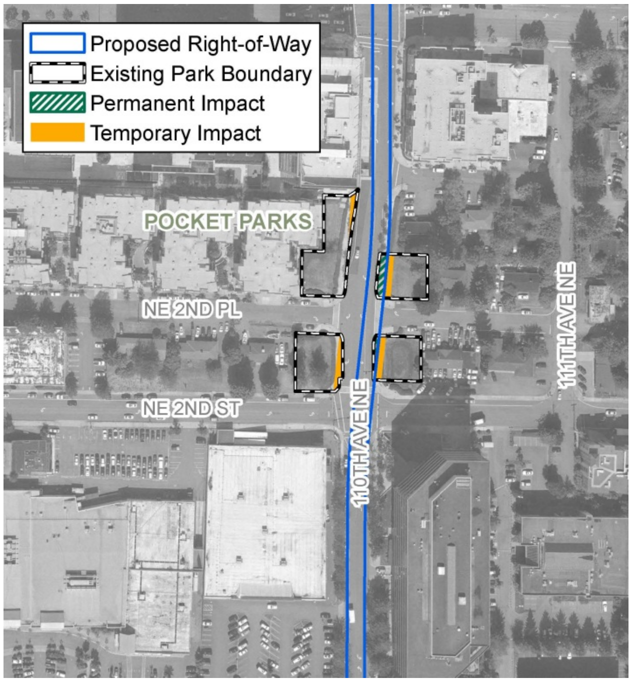

EXHIBIT4.17-10
Alternative C9A Pocket Park Impact Area

Segment D

A proposed storage track would remain inside the former BNSF Railway corridor north of NE 12th Street overcrossing if the interim station were to be the Hospital Station in Segment C or another station in Segment D. The proposed design is compatible with a future trail, which would be developed by others.

Preferred Alternative D2A would not impact any existing park or open space resources.

Highland Park and Community Center is located near the NE 20th Alternative (D3), but no direct or proximity impacts are anticipated for this resource.

Segment E

The Segment E alternatives would impact six park, open space, and trail facilities. The impacts are listed in Table 4.17-4 and shown in Exhibit 4.17-11, and they are discussed below by alternative.

Preferred Marymoor Alternative (E2) would impact 4 of the 15 existing parks and recreational facilities identified in Segment E (three trails and Marymoor Park). *Preferred Alternative E2* would cross under the Bridle Crest Trail at NE 60th Street. The Bridle Crest Trail would not be affected because the alternatives would be located under the NE 60th Street overpass, where the trail passes. Although equestrians are known to use this trail, given the existing noise levels and presence of SR 520, no impacts would be expected during operation.

TABLE 4.17-4
Segment E Parks and Open Spaces Permanent Impacts

Impact Area	**Park Name**						
	Town Center Open Space (acres)	**Luke McRedmond Landing (acres)** [a]	**Marymoor Park (acres)**	**Sammamish River Trail (acres)**[a]	**East Lake Sammamish Trail**	**Bear Creek Trail (acres)**[a]	**The Edge Skate Park (acres)**
Preferred Marymoor Alternative (E2)	None	None	2.0	None[b]	Trail section relocation	0.1	None
E2 - Redmond Transit Center Design Option	None	None	2.0	None[b]	Trail section relocation	0.1	Less than 0.1
Redmond Way Alternative (E1)	None	0.1	None	0.1	Trail section relocation	0.1	None
Leary Way Alternative (E4)	0.7	None	None	0.1	Trail section relocation	0.1	None

[a] Acres impacted are associated with shading due to the elevated structure, which would also require a permanent aerial easement.

[b] Impacts to this trail for *Preferred Alternative E2* and E2 – Redmond Transit Center Design Option are counted under impacts to Marymoor Park.

The SE Redmond Station offers closer access to Marymoor Park recreationists with *Preferred Alternative E2* than it does with Alternatives E1 and E4, although access to the park could be improved under all alternatives. *Preferred Alternative E2* would acquire approximately 2.0 acres of park property along the northern edge of the 640-acre Marymoor Park (0.4 acre elevated and 1.6 acres at-grade), south of SR 520, which would represent less than 1 percent of the park area (Exhibit 4.17-11). No recreational park facilities would be directly affected by East Link operations; however, equestrian riders have been known to ride along the park's northern property boundary, and an unofficial equestrian route exists. Existing park uses adjacent to the route include a multipurpose event park, informal recreational uses, and the velodrome. This route might need to be relocated if there is not enough distance between the light rail and the soccer and ball fields to accommodate these users. Given the existing proximity to SR 520 and vegetation in this area, users would not likely experience additional proximity impacts from the project.

Certain areas of Marymoor Park along SR 520 and the central section would not be considered noise-sensitive under FTA criteria because the primary uses in these areas are for active uses. This area is also near SR 520 to the north and adjacent to a commercial and industrial area to the east. Only the southern section of the Marymoor Park, near Lake Sammamish, is considered noise-sensitive where quiet is an essential element of the park. Project alternatives are approximately 2,500 to 3,000 feet from these uses. Project noise levels are predicted to be below existing noise levels and below the FTA noise impact criteria. Even though *Preferred Alternative E2* travels along the areas of the park that are not noise-sensitive, Sound Transit, in consultation with King County, will evaluate noise impacts, consistent with FTA noise analysis methods and criteria, to park uses in place in the future when funding is secured and the design advances.

Preferred Alternative E2 would cross the Sammamish River Trail in an area where the trail is located within Marymoor Park. This would result in some shading from the elevated structure. One or more columns would likely be placed near the trail. This trail currently passes underneath three other overpasses in this area, including SR 520, located 80 feet away.

Preferred Alternative E2 would potentially realign and relocate a portion of the East Lake Sammamish Trail, to be developed by others, within its existing corridor. Also, one or more columns likely would be placed near the trail. Project operation would not impact access to the trail and its connection to the Bear Creek Trail, although the elevated portion of the structure would result in some shading (0.1 acre). The corridor has an urban and transportation character; it is in a former railroad corridor and contains an existing SR 520 overpass. Therefore, the visual change of the East Link Project would not substantially impair views from the trail.

In order for the light rail guideway to cross over Bear Creek Trail, the trail would be lowered by 20 feet in a retained cut. This would place the trail in a short retained cut pathway for approximately 30 feet, but this impact would not impair the trail's continued use.

Exhibit 4.17-11 **Affected Park Area Within Proposed Right-of-Way**
Segment E
East Link Project

Lowering the trail would maintain the shallow gradient, width, and height clearance to accommodate all trail users. A column could be placed near the trail, but it would not impair the trail's use. The trail would be fully restored following construction. In addition to the impacts from *Preferred Alternative E2*, the E2 - Redmond Transit Center Design Option would impact a portion of The Edge Skate Park, located along 161st Avenue NE at NE 83rd Street. The design option would require a small portion, less than 0.1 acre (at-grade) of the western portion of the park that contains the sidewalk and narrow lawn area, but would not affect any recreational facilities.

The City of Redmond has plans to locate a stormwater pipe, trail, and linear park within the former BNSF Railway corridor in downtown Redmond, while also accommodating regional utilities and infrastructure, including Sound Transit's light rail project. Space constraints in this corridor could require relocating any of these uses. If the Central Connector trail/park is impacted by any of the Segment E alternatives, then the trail would be relocated, affected park amenities replaced, and vegetation restored as agreed to with the City.

The other Segment E alternatives would affect 4 of the 15 Segment E existing parks and recreational areas. All Segment E alternatives would cross under the Bridle Crest Trail at NE 60th Street, but no impacts would be likely during operation as described for *Preferred Alternative E2.* The Redmond Way Alternative (E1) would result in direct impacts along the south side of Redmond Way, shifting the elevated light rail structure into Luke McRedmond Landing. This would involve removing mature trees lining Redmond Way, and 0.1 acre of the park would be under the elevated structure. However, no recreational park facilities would be impacted. Because the light rail structure would be elevated approximately 30 feet above the park in this area, the structure would become a dominant and noticeable feature in the park, which would affect the visual experience for some park users, but the visual character of the park itself and transportation facilities adjacent to the park would not change.

The elevated route would span two segments of the Sammamish River Trail, resulting in minor shading of this trail (0.1 acre). This trail already passes underneath three other overpasses in this area, including the SE Redmond Way overpass 30 feet away. It is also likely that one or more columns would be placed near the trail (on either the west or east side of the river).

Alternative E1 would also cross the Bear Creek Trail, resulting in some shading on the trail (0.1 acre). Because the light rail structure would be elevated approximately 35 feet above the trail in this area, the structure would affect the visual environment for some trail users. It is also likely that one or more columns would be placed near the Bear Creek Trail. Alternative E1 would require minor realignment of the existing East Lake Sammamish Trail in the area along the former BNSF Railway corridor. Overall, access among the various trails in the area would not be impacted by project operation. No impacts on Marymoor Park or the Town Center Open Space would occur under Alternative E1. This alternative would provide enhanced access to Marymoor Park via the Downtown and SE Redmond Stations.

Leary Way Alternative (E4) would require right-of-way along the eastern side of Leary Way NE in the Town Center Open Space. This would impact 0.7 acre (0.1 elevated and 0.6 at-grade) and remove some mature trees along the edge of this open space. Trees would remain farther south into the open space, somewhat screening the light rail from users further south. Impacts on Bear Creek Trail and East Lake Sammamish Trail would be similar to those under the Redmond Way Alternative (E1), although Alternative E4 would cross over the Bear Creek Trail at half the height of Alternative E1, or approximately 18 feet. No impacts on Luke McRedmond Landing or Marymoor Park would occur under this alternative. Dudley Carter Park, to the north of Leary Way, would not be adversely affected by project alternatives (i.e., there would be no direct acquisition or proximity impacts).

Maintenance Facilities

The NE 116th Maintenance Facility (MF1) and the BNSF Maintenance Facility (MF2) would be located adjacent to the former BNSF Railway corridor, and should the maintenance facility be located in either location the proposed design is compatible with a future bike and pedestrian trail in this area.

The SE Redmond Maintenance Facility (MF5) would be located adjacent to the East Lake Sammamish Trail. However, because the trail currently exists adjacent to large-scale light industrial development, no impacts are anticipated.

4.17.3.3 Impacts during Construction

Where alternatives are located adjacent to or on park property, park users might experience proximity effects including increased noise, dust, and temporary use and access restrictions. Proposed parks and trails are not addressed in this section because there would be no construction impacts to undeveloped resources. These effects are considered temporary, except for

Section 6(f) parks (parks developed using LWCF Funds). Section 6(f) park lands are considered to be directly impacted if construction prohibits normal park use for more than 180 consecutive days. This pertains only to one portion of the Mercer Slough Nature Park (see Appendix D, Section 4(f)/6(f) Evaluation). Chapter 2 discusses types of activities associated with construction staging.

Segment A, *Preferred Interstate 90 Alternative (A1)*

Benvenuto Viewpoint in Seattle and Park on the Lid, and possibly the Outdoor Sculpture Gallery, on Mercer Island would experience increased noise, dust, and temporary closures and detours around the parks as construction of the station entrances is completed. Construction would not inhibit normal use of the parks from other points of access. If the pedestrian bridge option is built, then a portion of the Outdoor Sculpture Gallery would likely be closed and detours around the park would be provided during construction.

Segment B

Segment B alternatives would have construction impacts on two parks, Mercer Slough and Bellevue Way Greenbelt (Table 4.17-5).

TABLE 4.17-5
Segment B Required Parks Construction Area

Alternative	Mercer Slough Nature Park (acres)	Bellevue Way Greenbelt (acres)
Preferred Alternative B2M[a]	3.6	None
Bellevue Way Alternative (B1)	2.6	Less than 0.1
112th SE At-Grade Alternative (B2A)	2.5	0.1
112th SE Elevated Alternative (B2E)	1.8	None
112th SE Bypass Alternative (B3)	2.5	0.1
114th Extension Design Option (B3)	2.6	0.2
BNSF Alternative (B7)	1.7	None

[a] Only for connector to *Preferred Alternative C11A* only.

Construction activities associated with *Preferred Alternative B2M* would encroach into Mercer Slough Nature Park, requiring an additional 3.6 acres beyond operation right-of-way acquisition (Exhibit 4.17-2) for a temporary construction easement and staging area. *Preferred Alternative B2M* would result in more temporary park acquisition for construction than the other Segment B alternatives. After construction, these areas would be restored with appropriate landscaping. Light rail construction in the western edge of Mercer Slough Nature Park would result in increased noise, dust, and temporary access restrictions to western areas of the park, but would not inhibit normal use of most of the park's resources.

The Periphery Loop Trail sidewalk on the eastern side of Bellevue Way SE would be maintained and/or relocated as necessary for safety purposes. Options may include: providing protected sidewalk on the eastern side of Bellevue Way SE or constructing a new sidewalk on the western side of Bellevue Way SE. Access to Sweylocken Boat Ramp, the I-90 Trail, or other Mercer Slough Nature Park Trails would generally be maintained during construction, but there would be no access to the trails north of the South Bellevue Park-and-Ride. Access would be maintained during construction to the trails located south of the park-and-ride through detours.

Construction along 112th Avenue SE could result in increased noise and dust near the water trail but would not likely inhibit normal trail use because this is a short section of trail that is currently between an office park and 112th Avenue SE roadway. Also, the Winters House would be closed so the Eastside Heritage Center would be relocated during construction.

Construction activities would require closing the Winters House and adjacent parking and also temporarily relocate of the retail component of the blueberry farm, which would be relocated to enable the business to continue operation during construction. Farming operations to the blueberry farm would be maintained during construction, but there would be no public access. Closing parking at the Winters House and closing the South Bellevue Park-and-Ride would reduce available parking in the western side of the park. Temporary parking for park users would be provided as agreed to by the City. Constructing *Preferred Alternative B2M* would not substantially affect park use or diminish its value due to the project's location along the park's boundary with Bellevue Way SE. Construction would not inhibit normal park access and use on the park's east side. There would be no direct construction impact on the Bellevue Way Greenbelt.

For Alternatives B2A, B2E, B3, and B3 - 114th Extension Design Option, reconstructing Bellevue Way SE and the sidewalk adjacent to Mercer Slough Nature Park would result in increased noise, dust, and temporary access restrictions to western areas of the park, although detours would be provided to maintain access to trails in this area (Exhibit 4.17-2). Construction would not be expected to inhibit normal use of the park from other points of access. The blueberry farm would experience construction-related impacts. A portion of the entrance to the Mercer Slough Blueberry Farm would need to be reconstructed to accommodate either the light rail structure or the shifted roadway closer to the farm.

Portions of the Mercer Slough Nature Park could be acquired as a temporary construction easement for use as a staging area for construction at a width that encroaches roughly 50 feet into the park, except for the location at the Winters House, where the proposed right-of-way would be widened to the west, holding the existing east right-of-way in its current location. In addition, Alternatives B2A, B3, and B3 - 114th Extension Design Option would encroach 0.1 to 0.2 acre into the Bellevue Way Greenbelt during construction. Construction of Alternative B1 would encroach less than 0.1 acre into the Bellevue Way Greenbelt.

To construct Alternative B7, a construction corridor up to 85 feet wide and along the north side of I-90 would be cleared and a temporary construction trestle may be built under the elevated guideway in the park. Section 2.4 of Chapter 2 discusses potential construction easements. Although the park is close to an existing noise generator (I-90), temporary noise from East Link construction would be greater than noise typically experienced in this area. In addition, this portion of the park, the I-90 trail, as well as the canal on the west side of the park near the I-90 off-ramps, would likely be intermittently closed to public access during construction for safety considerations. Once construction is completed, the area along the light rail elevated guideway would be revegetated and returned to parklands and the trail would remain unaltered. Wetland vegetation in the guideway construction area is expected to return to its current growth pattern within 10 years.

Segment C

Preferred Alternative C11A would temporarily acquire 0.6 acre of Surrey Downs Park for a construction easement (Table 4.17-6). Constructing the guideway would close the north access point to the park located along 112th Avenue SE and would also require right-in/right-out turn movements. Vehicle and pedestrian access to the park from 112th Avenue SE would be maintained during construction at the southern access point. Any construction impacts, such as noise, dust, visual change, and reduced parking, would be noticed by park users but would not inhibit normal park use as active park use areas are not along 112th Avenue SE.

TABLE 4.17-6
Segment C Required Parks Construction Area

Alternative	Surrey Downs Park (acres)	Pocket Parks (acres)	McCormick Park (acres)
Preferred 108th NE At-Grade Alternative (C11A)	0.6	None	None
Preferred 110th NE Tunnel Alternative (C9T)	0.5	0.3	None
106th NE Tunnel Alternative (C2T)	5.7[a]	None	None
108th Ave Tunnel Alternative (C3T)	5.7[a]	None	1.8
Couplet Alternative (C4A)	0.4[a]	0.3	1.3
112th NE Elevated Alternative (C7E)	0.4[a]	None	None
110th NE Elevated Alternative (C8E)	None	0.1	0.8
110th Ave NE At-Grade Alternative (C9A)	Less than 0.1	0.1	None

[a] Only for connector from *Preferred Alternative B2M* to *Preferred Alternatives C11A* or *C9T* and from Alternative B2A to Alternatives C2T, C3T, C4A, and C7E.

Preferred Alternative C9T would require a 0.5-acre temporary construction easement in Surrey Downs Park. During construction park users would not be able to access the northeast corner of the park and the north access point would be closed, resulting in similar impacts as those described under *Preferred Alternative C11A*. Vehicle and pedestrian access to the park from 112th Avenue SE would be maintained during construction.

Construction impacts such as noise, dust, visual change, and reduced parking would be noticed by park users but would not inhibit normal use of the park. The active use areas of the park are located in the southern portion of the park away from construction activities.

Construction activities associated with the cut-and-cover tunnel for *Preferred Alternative C9T* would acquire a sliver of the southeast quadrant of the NE 2nd Pocket Parks for a construction easement and close the northeast quadrants, approximately 0.3 acre (Exhibit 4.17-6). Once construction is completed, this park area in the southeast and northeast quadrants would be restored. Access would be maintained to the other quadrants as much as possible. Since these parks are only operating as open space, it would not affect park users, but people passing by would experience construction noise, dust, and visual change.

Table 4.17-6 lists the area required for construction staging in parks in Segment C. The northern half of

Surrey Downs Park where the King County District Courthouse is located would be used as staging to construct the tunnel portals for Alternative C2T or C3T if connecting from Alternative B2A in Segment B. The southern half of the park containing the existing park facilities would remain open during construction, although park users would experience proximity impacts from adjacent construction, including noise and dust. Vehicle access would likely be limited to only one of the two current entrances. Pedestrian access to adjoining neighborhoods would be maintained at two of the three current locations. Parking would also be limited because half of the parking is located at the north end of the site, although much of that parking serves the King County District Courthouse. Removing the courthouse would benefit the park (as described in Section 4.17.3.2, Impacts during Operation). Depending on when Bellevue begins implementing the *Surrey Downs Park Master Plan*, construction staging at this location could delay construction of some master plan features.

Alternatives C4A and C8E would impact the City of Bellevue NE 2nd Pocket Park during project construction for a temporary construction easement and staging. Once construction is completed, this park area would be restored. During construction, the northeast park quadrant would be closed for Alternative C8E, but access would be maintained to the other quadrants. Construction activities associated with the cut-and-cover tunnel and Bellevue Transit Center Station entrance for *Preferred Alternative C9T* would use both park quadrants on the east side of 110th Avenue NE and the northwest quadrant, for a total construction easement of approximately 0.3 acre. The northwest and northeast quadrant would be closed during construction with the northeast quadrant being used as part of a larger staging area. Park users would experience noise, dust, and visual change. After construction, the northwest quadrant of the pocket park would be more accessible to the public through the station entrance plaza.

Under Alternatives C3T and C4A, McCormick Park would be closed during construction from 108th to 112th Avenue NE. Under Alternative C8E, the park would be closed during construction from roughly 110th to 112th Avenue NE. Under each of these alternatives, pedestrians would be directed to the open portions of the park during construction. These areas would be restored following construction, and adjacent parcels acquired for construction staging would be used to create new parkland once the project is constructed, resulting in a net gain in parkland.

Alternative C9A would acquire less than 0.1 acre of the pocket park as a temporary construction easement along the east and west sides of 110th Avenue NE. Access would be maintained to the other areas of the park, and park users would experience construction noise, dust, and visual change.

Segment D

No impacts on parks or open space would occur during construction.

Segment E

To construct *Preferred Alternative E2* south of SR 520, a temporary access road would likely be built in the northern portion of Marymoor Park. The total encroachment into the park (beyond what is described in the operational impacts section) would add approximately 15 to 50 feet for the length of the park along SR 520, measuring approximately 3 acres (Table 4.17-7). Although the park is close to an existing noise generator (SR 520), temporary noise from construction could be greater than noise typically experienced in this area. Park users in Luke McRedmond Landing and the Town Center Open Space could experience increased noise and dust during construction of *Preferred Alternative E2*. At Luke McRedmond Landing, some parking spaces could be temporarily removed to accommodate construction.

TABLE 4.17-7
Segment E Required Parks Construction Area

Alternative	Marymoor Park (acres)	Luke McRedmond Park (acres)	Town Center Open Space (acres)	The Edge Skate Park (acres)	Sammamish River Trail Site
Preferred Alternative E2	3	none	Less than 0.1	none	none[a]
E2 – Redmond Transit Center Design Option	3	none	0.3	0.2	none[a]
Redmond Way Alternative (E1)	none	0.1	none	none	0.1
Leary Way Alternative (E4)	none	none	0.4	None	Less than 0.1

[a] Impacts to this trail for Preferred Alternative E2, and E2-Transit Center Design Option are counted under Marymoor Park

The East Lake Sammamish Trail would be realigned and reconstructed where it exists in the same corridor as the *Preferred Alternative E2* west of SR 520, requiring closures and detours. Temporary trail closures, detours, or protective barriers would be also implemented to maintain trail usage when construction would occur over the Sammamish River Trail and the Bear Creek Trail and under the Bridle Crest Trail.

Other Segment E Alternatives
Table 4.17-7 lists the area required for construction staging in parks in Segment E. E2- Redmond Transit Center Design Option would have the same impacts to Marymoor Park and Segment E trails as *Preferred Alternative E2*. In addition, users of The Edge Skate Park could experience proximity impacts because the alternative would be constructed directly adjacent to this facility.

For Alternatives E1 and E4, the East Lake Sammamish Trail would also require minor realignment east of SR 520 in the former BNSF Railway right-of-way. Similar to *Preferred Alternative E2*, Alternatives E1 and E4 would require temporary trail closures, detours, or protective barriers to maintain trail usage of Bridle Crest Trail, Sammamish River Trail, Bear Creek Trail, and East Lake Sammamish Trail during construction.

Maintenance Facilities

Because the East Lake Sammamish Trail would be reconstructed under Alternatives E1 and E4, no additional impacts are expected during construction of the maintenance facilities.

4.17.4 Potential Mitigation Measures

Sound Transit would restore disturbed park and open space to pre-project conditions after construction in cooperation with the resource owner. This would include landscaping, paths, and any built features of the park and trail resources. Other measures to mitigate affected parks and open space include providing replacement lands, financial compensation, or park enhancement, where appropriate. During construction, pedestrian access to parks and trails would be routed to the remaining open portions of the facilities. Dust from construction would be mitigated using dust control measures described in Section 4.6, Air Quality. Visual and noise impacts would be mitigated using measures described in Section 4.5, Visual and Aesthetic Resources, and Section 4.7, Noise and Vibration.

As part of the Section 4(f) process, Sound Transit has consulted with the Cities of Seattle, Mercer Island, Bellevue, and Redmond and with King County about potential impacts on parks under their jurisdiction and possible mitigation measures. With the exception of the City of Bellevue, the agencies with jurisdiction over parklands have concurred regarding the scope of potential project impacts and associated mitigation measures. The cities of Seattle, Mercer Island, Redmond, and King County have provided 4(f) letters of concurrency, which are included in Appendix D. Table 4.17-8 includes the mitigation measures that are consistent with the letters of 4(f) concurrency for each affected recreational resource and also includes proposed mitigation for City of Bellevue park impacts. Not all mitigation measures would be necessary or implemented where multiple mitigation options are described in the Table 4.17-8.

Sound Transit has also consulted with the Washington RCO and the National Park Service regarding potential LWCF Section 6(f) and RCO funded property conversion. Appendix D discusses converting these properties and requirements regarding replacement properties.

TABLE 4.17-8
Potential Mitigation for Identified Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
Segment A, Interstate 90			
Benvenuto Viewpoint	WSDOT, City of Seattle	**Permanent:** ▪ Design station entrance to be compatible with the City's park design. **Temporary:** ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative A1*
Park on the Lid	WSDOT	**Permanent:** ▪ Station entrance designed to be compatible with the surrounding design of the park. **Temporary:** ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative A1*

TABLE 4.17-8 CONTINUED
Potential Mitigation for Identified Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
Outdoor Sculpture Gallery	WSDOT, Mercer Island	**Permanent:** ▪ Design station entrance to be compatible with the surrounding the park. **Temporary:** ▪ Restore temporarily disturbed area to existing conditions.	A1 - Mercer Pedestrian Bridge Design Option
Segment B, South Bellevue			
Mercer Slough Nature Park	City of Bellevue	**Permanent:** ▪ Acquire replacement land pursuant to Washington State Recreation and Conservation Office (RCO) and Section 6(f) requirements that would be consistent with the natural character of the park. ▪ Have an option to preserve existing vehicle access to Sweylocken boat ramp. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Provide temporary parking for users off Bellevue Way and south of the park-and-ride or as agreed to with the City. ▪ Relocate blueberry farm retail use during construction. ▪ Maintain blueberry farm operations. ▪ Relocate Eastside Heritage Center during construction. ▪ Maintain access or provide detours for trails, and maintain access to Sweylocken boat ramp.	*Preferred Alternative B2M*
		Permanent: ▪ Acquire replacement land pursuant to RCO and Section 6(f) requirements or provide financial compensation as agreed with the City. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Maintain access or provide detours for trails, and maintain access to Winters House, blueberry farm, and boat launch where affected as agreed to with City. ▪ Provide new signal for full access to boat launch (Alternative B1 only).	All Segment B alternatives, except *Preferred Alternative B2M*
Bellevue Way Greenbelt	City of Bellevue	**Permanent:** ▪ Provide financial compensation or replacement land as agreed with City.	Alternatives B1, B2A, B3, and B3 - 114th Extension Design Option
Segment C, Downtown Bellevue			
Surrey Downs Park	City of Bellevue	**Permanent:** ▪ Replace impacted acreage with the acquired properties north of the park along 112th Avenue SE and provide landscaping. ▪ Design treatments of the retaining wall and fence along 112th Avenue SE in consultation with the City. ▪ Design and construct a U-turn on 112th Avenue SE at SE 8th Street. Prepare conceptual layout for two northbound-to-southbound U-turn options – one at SE 6th Street and one at Main Street – to accommodate those coming from the south who would want to turn left into the park; the City and Sound Transit would pick one that Sound Transit would design and construct. ▪ Coordinate with City of Bellevue and community to revise the Surrey Downs Master Plan to address the impacted area. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed with City. ▪ Restore the temporarily disturbed area with landscaping in accordance with the Surrey Downs Master Park Plan. ▪ Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public parking and access for scheduled baseball/soccer fields (spring, late summer, and fall). ▪ Provide a barrier or fence adjacent to the main construction area. ▪ Improve south driveway to increase traffic flow before closing north driveway.	*Preferred Alternative C11A* from *Preferred Alternative B2M*

TABLE 4.17-8 CONTINUED
Potential Mitigation for Identified Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
Surrey Downs Park continued	City of Bellevue continued	**Permanent:** ▪ Replace impacted acreage with the acquired properties north of the park along 112th Avenue SE, and provide landscaping. ▪ Design treatments of the retaining wall and fence along realigned SE 4th Street in consultation with the City. ▪ Coordinate with City of Bellevue and community to revise the Surrey Downs Master Plan to address the impacted area. **Temporary:** ▪ Provide financial compensation for the temporary use of land as agreed with the City. ▪ Restore the temporarily disturbed area with landscaping in accordance with the *Surrey Downs Master Park Plan*. ▪ Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public parking and access for scheduled baseball/soccer fields (spring, late summer, and fall). ▪ Provide a barrier or fence adjacent to the main construction area. ▪ Improve south driveway to increase traffic flow prior to closure of the north driveway.	*Preferred Alternative C9T* connecting to *Preferred Alternative B2M*
		Permanent: ▪ Provide financial compensation or replacement land as agreed with the City. **Temporary (Alternative C2T and C3T from Alternative B2A):** ▪ Provide financial compensation for the use of land as agreed with the City. ▪ Restore landscape after construction to existing conditions or as agreed to with the City; maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public access and parking for scheduled baseball/soccer fields (spring, late summer, and fall). ▪ Provide a barrier or fence adjacent to the main construction area. **Temporary (Alternative C4A, C7E, and C9A from Alternative B2A only):** ▪ Provide financial compensation for the temporary use of land as agreed with the City. ▪ Restore temporarily disturbed park area to existing conditions.	Alternatives C3T, C2T, C4A, and C7E connecting from Alternative B2A
NE 2nd Pocket Parks	City of Bellevue	**Permanent:** ▪ One, or a combination of the following, as agreed to with the City: — Provide financial compensation as agreed to with the City. — Provide replacement land with an equivalent portion of the project's staging area located on the northeast quadrant of the park. — Enhance entire northwest quadrant of the park as a public plaza in conjunction with the station entrance. **Temporary** ▪ Provide financial compensation for the temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed park area to existing conditions. ▪ Preserve pedestrian access to southern park quadrants.	*Preferred Alternative C9T* connecting to *Preferred Alternative B2M* and Alternatives B2A, B2E, and B7
		Permanent (Alternatives C4A and C9A from Alternatives B2A, B2E, and B3 only): ▪ Provide financial compensation or replacement land as agreed to with the City. **Permanent (Alternative C8E from Alternatives B3 and B7 only):** ▪ Provide financial compensation or replacement land as agreed to with the City. ▪ Add visual and aesthetic design measures, as agreed to with the City. **Temporary:** ▪ Provide financial compensation for the temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed park area to existing conditions. ▪ Preserve pedestrian access to southern park quadrants.	Alternatives C4A and C9A from B2A, B2E, B3, B7; Alternative C8E from B3 and B7

TABLE 4.17-8 CONTINUED
Potential Mitigation for Identified Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
McCormick Park	City of Bellevue	**Permanent:** ▪ One or more of the following measures would be implemented: — Acquire replacement land for permanent use impacts. Results in net increase in park land for some alternatives. — Provide financial compensation for use during construction. **Temporary:** ▪ Restore disturbed area after construction.	Alternatives C3T and C4A from Alternatives B2A, B2E, B3, and B7; Alternative C8E from Alternatives B3 and B7
Segment D, Bel/Red-Overlake			
No parks affected			
Segment E, Downtown Redmond			
Marymoor Park	King County	**Permanent:** ▪ Acquire replacement recreation land equal in value and function to offset the light rail use within the park property. ▪ Evaluate noise impacts to park uses in place, when Segment E is funded, consistent with FTA noise analysis methods and criteria when design is advanced. **Temporary:** ▪ Mitigate temporarily disturbed park lands pursuant to RCO regulations. ▪ Provide financial compensation for temporary use of land outside the light rail right-of-way for construction; restore parkland following construction.	*Preferred Alternative E2* and E2 - Redmond Transit Center Design Option
Town Center Open Space	City of Redmond	**Permanent:** ▪ One or more of the following measures would be implemented: — Acquire replacement land for permanent use impacts. — Provide financial compensation. **Temporary:** ▪ Restore disturbed park area.	Alternative E4
		Temporary: ▪ Restore disturbed park area.	*Preferred Alternative E2* and E2 - Redmond Transit Center Design Option
Luke McRedmond Landing	City of Redmond	**Permanent:** ▪ One or more of the following measures would be implemented: — Provide financial compensation for permanent aerial easement or improvements to the park as agreed to with the City. — Replace trees removed per City tree ordinance. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction, as agreed to with the City. ▪ Maintain access to the park during construction. ▪ Restore temporarily disturbed area to existing conditions.	Alternative E1
Bear Creek Trail	City of Redmond	**Permanent:** ▪ Reroute trail during construction, restore disturbed trail area after construction, and replace trees. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction, as agreed with the City. ▪ Maintain access or provide detours for trail during construction. ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative E2* and Alternatives E2 - Redmond Transit Center Design Option

TABLE 4.17-8 CONTINUED
Potential Mitigation for Identified Impacts

Facility Name	Jurisdiction	Potential Mitigation	Associated Alternatives
		Permanent: ▪ Provide financial compensation for permanent aerial easement or improvements to the trail as agreed to with the City of Redmond. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction, as agreed with the City. ▪ Maintain access or provide detours for trail during construction. ▪ Restore temporarily disturbed area to existing conditions.	Alternatives E1, and E4
Redmond Central Connector Trail/Park Corridor	City of Redmond	**Permanent:** ▪ Possibly permanent reroute of trail, and replace affected park amenities and associated vegetation as agreed to with the City. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction as agreed to with the City. ▪ Maintain access or provide detours for trail during construction. ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative E2* and Alternatives E2 - Redmond Transit Center Design Option, E1, and E4
Sammamish River Trail	King County	**Permanent:** ▪ Acquire replacement recreation land equal in value to offset the light rail within the trail right of way per RCO requirements. ▪ Locate guideway columns outside trail clear zone as practical. **Temporary:** ▪ Provide financial compensation for temporary use of land outside of the light rail right-of-way for construction. ▪ Reroute and restore trail to King County standards and specifications during and after construction.	*Preferred Alternative E2* and Alternatives E2 - Redmond Transit Center Design Option, E1, and E4
East Lake Sammamish Trail	King County	**Permanent:** ▪ Provide financial compensation for the light rail use of the trail right of way. **Temporary:** ▪ Provide financial compensation for temporary use of land outside of the light rail right-of-way during construction. ▪ Reroute and restore trail to King County standards and specifications during and after construction.	*Preferred Alternative E2* and Alternatives E2 - Redmond Transit Center Design Option, E1 and E4
Edge Skate Park	City of Redmond	**Permanent:** ▪ Provide financial compensation for the light rail use of park as agreed to with the City. **Temporary:** ▪ Provide financial compensation for the temporary use of land during construction, as agreed to with the City. ▪ Maintain access to the park during construction. ▪ Restore temporarily disturbed area to existing conditions.	E2 - Redmond Transit Center Design Option

Chapter 5

Cumulative Impacts

5.1 Introduction

As defined in 40 Code of Federal Regulations (CFR) 1508.7, cumulative impacts on the environment result "from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." The public and government agencies need to understand cumulative impacts to evaluate a proposed action and its alternatives in a broad perspective, including how the project might interact with impacts that persist from past actions, with present-day activities, and with other projects that are planned but have not been built yet. A cumulative impact assessment can reveal unintended consequences that might not be apparent when the project is evaluated in isolation instead of in a broader context.

The need to analyze cumulative impacts has influenced all components of the East Link Project environmental review process, including scoping, describing the affected environment, developing the alternatives, and evaluating environmental impacts. The cumulative impact assessment follows the National Environmental Policy Act (NEPA) (40 CFR 1500-12508), the approach recommended by the President's Council on Environmental Quality (CEQ) in *Considering Cumulative Effects Under the National Environmental Policy Act* (CEQ, 1997), and the following additional guidance documents:

- *Consideration of Cumulative Impacts in EPA Review of NEPA Documents* (EPA, 1999)
- *Interim Guidance: Questions and Answers Regarding Indirect and Cumulative Impact Considerations in the NEPA Process* (Federal Highway Administration, 2003)
- *Guidance on the Consideration of Past Actions in Cumulative Effects Analysis* (CEQ, 2005)
- Executive Order 13274 Indirect and Cumulative Effects Work Group Draft Baseline Report (ICF Consulting, 2005)
- Indirect and Cumulative Impact Analysis (National Cooperative Highway Research Program, 2006)

During the East Link scoping process and Draft Environmental Impact Statement (EIS) preparation, Sound Transit gathered information from other agencies and the public to identify impacts of past and present developments and reasonably foreseeable future actions that could interact with the East Link Project alternatives. Examples of these information sources include the following:

- King County and the Cities of Seattle, Mercer Island, Bellevue, and Redmond provided land use plans, transportation plans, neighborhood plans, and lists of known, major land use proposals.
- The Washington State Department of Transportation (WSDOT) and King County Metro Transit provided information on planned transportation projects and developments.
- The Puget Sound Regional Council (PSRC) provided population and employment growth projections, travel forecasts, and land use projections.
- Other organizations and the public provided information on planned private projects, community values, and concerns.

This information was used to identify past and ongoing development trends, prepare growth projections, characterize reasonably foreseeable future actions, and identify and evaluate expected cumulative impacts to which the East Link Project could contribute.

5.2 Geographic and Temporal Boundaries of Cumulative Analysis

Consistent with regulatory guidance for a cumulative impact analysis, the development actions that were considered include those that are past, present, and reasonably foreseeable. For the purpose of this analysis, development actions were assigned to those three categories as follows:

- Past actions include nonnative settlements dating back to the 1800s and continuing trends in development patterns up to the present.

- Present actions are those projects by local, state or federal agencies just completed or under construction.
- Reasonably foreseeable future actions are those that have obtained local, state, or federal government approval and thus could be under construction at any time between the present through 2030 (the East Link Project's design year).

The study area for cumulative analysis is generally a combination of the study areas defined in Chapter 3 for transportation facilities and in Chapter 4 for the various environmental resources. The exceptions are ecosystem-related resources, where broader study areas are necessary to capture how the impacts from reasonably foreseeable future projects may interact to affect the function of larger ecosystems. Wildlife corridors are considered for avian species and other migratory animals or animals with large foraging areas. Fish habitats are considered at the watershed level for impacts on stream quality.

The Puget Sound region study area applies to resources such as transportation, air quality (including greenhouse gases [GHG]), energy, and, to some degree, economics on the regional level. Greenhouse gases are studied at the regional level, while it is acknowledged that their impacts are felt on the global level. Social resources that may experience a range of cumulative impacts from new infrastructure projects (such as land use, local economic business, social impacts and neighborhoods, public services, visual resources, and parklands) were generally analyzed within one-half mile to one mile of the project alternatives. For built environmental resources (such as property, hazardous materials, geology, electromagnetic fields, utilities, historic and archaeological resources, and noise and vibration), the study area is approximately one-quarter mile or less around project alternatives.

5.3 Past and Present Actions

Impacts from past actions have shaped the project vicinity since the mid-19th century, and they continue to shape how the Seattle and Eastside areas are changing in response to activities and trends. Starting with the first nonnative settlements along the Duwamish River in the 1850s, development of the Seattle area was driven by timber harvesting, commercial fishing, shipbuilding, merchant shipping, railroads, aircraft manufacturing, and other heavy industry, as well as by development and expansion of the state and federal highway systems and by residential communities with their supporting infrastructure. This development transformed the project vicinity from tidelands and forested wilderness to a densely populated, urban environment. As Seattle became increasingly urban, dispersed suburban-population growth spread to surrounding areas. Such growth was notable in the decades after World War II, and it rapidly accelerated from the 1980s to the present.

On the Eastside, homesteaders began to settle near Bellevue and Redmond in the 1890s. The Eastside remained rural for most of the first half of the 1900s, until roughly 1940 when the Lake Washington Floating Bridge (now I-90)—the first bridge over Lake Washington connecting Seattle and the Eastside—opened to traffic, leading to the creation of many auto-oriented suburban neighborhoods. During the 20 years after the bridge opened, the Eastside became the fastest growing part of the metropolitan area. Increasing traffic and delays on the Lake Washington Floating Bridge led to the completion of an additional crossing of Lake Washington, via the Evergreen Point Bridge (SR 520), in 1963. The rapid and continuing population growth and economic expansion that has persisted since then in the Bellevue-Redmond area has accelerated urban development. The development associated with this growth trend has created persistent cumulative impacts such as diminished air and water quality, ambient noise, and visual impacts, as well as loss, deterioration, and fragmentation of fish and wildlife habitats, including wetlands.

Recognizing that the pressure of increasing population growth would continue and intensify, in 1990 PSRC adopted *VISION 2020*, a long-range plan for the four-county central Puget Sound region, and updated the plan in 1995 (PSRC, 1995). The plan established an integrated, long-range growth management, economic, and transportation strategy based on a vision of high-density, urbanized centers linked by a high-quality multimodal transportation system. PSRC's *Destination 2030*, the transportation element of *VISION 2020*, provides a long-range plan for transportation in the central Puget Sound region through 2030, including light rail (PSRC, 2001). In 2008, PSRC recommitted the *VISION 2020* plan in the *VISION 2040* update, which was adopted in 2010. PSRC adopted its *Transportation 2040* plan in May 2010; this plan is the "action plan for transportation in the central Puget Sound region for the next 30 years." The East Link Project complies with goals and policies identified in PSRC's *VISION 2040* by providing a regional transit system that serves a growing transportation need for planned density of residential and employment uses within designated urban areas. *Vision 2040* focuses growth on regional growth centers, which are areas of higher densities of population and employment served by multimodal transportation. These centers also provide opportunities for arts, civic activity, commerce, and recreation. In the East Link Project study area, Downtown Bellevue, the Overlake neighborhood of Bellevue and Redmond, and Downtown Redmond are identified in *VISION 2040* as regional growth centers (PSRC, 2009).

5.4 Reasonably Foreseeable Future Actions

In this Final EIS, reasonably foreseeable future actions are future projects that will produce environmental impacts that could add to or interact with the East Link Project alternatives and other past and present actions to produce cumulative impacts. Reasonably foreseeable future actions are not speculative and are considered regardless of the agency, organization, or person serving as their proponent (CEQ, 1997). They must be likely to occur in the reasonably foreseeable future by virtue of being funded, approved, or under consideration for regulatory permitting; the subject of an environmental review process under NEPA or State Environmental Policy Act (SEPA); or part of an officially adopted planning document or publicly available development plan.

The following subsections provide a summary of the reasonably foreseeable future actions in the study area that could add to or interact with environmental impacts from the East Link Project alternatives and other past and present actions to produce cumulative impacts. Appendix F5 lists the projects considered in this analysis along with associated impacts declared during their environmental review process. The approximate locations of the regional transportation actions are shown in Exhibit 5-1. Specific public and private developments that were being planned or constructed at the time of EIS preparation are shown in Exhibits 5-2 and 5-3 and are described, along with known/recorded impacts, in Appendix F5.

5.5 Cumulative Impact Assessment

Adverse and/or beneficial cumulative impacts could occur over the longer term during project operation, when impacts of the East Link Project would add to or interact with long-term impacts of other past actions, present actions, and reasonably foreseeable future actions. Adverse cumulative impacts could occur over the short term during construction, when activities necessary to build the East Link Project would accumulate with impacts from other projects under construction at the same time. The following sections discuss expected cumulative impacts of project operation and construction on individual elements of the environment. The direct and indirect impacts of the project alternatives that could contribute to future cumulative impacts are discussed in Chapters 3 and 4.

Operation of the East Link Project would shift some vehicle trips to rail transit, thereby reducing cumulative impacts on traffic and bus transit movement, air quality, noise levels, water quality, and energy consumption compared to future conditions projected under the No Build Alternative. Therefore, East Link's key contribution would be to reduce the adverse cumulative impacts on these resources to levels below what they would be without the project.

Because analyses of transportation (Chapter 3), air quality (Section 4.6), energy (Section 4.10), and economics (Section 4.3) cannot be isolated from influences outside the East Link Project, they inherently include the impacts of other projects or processes. As such, these four analyses of East Link alternatives already incorporate impacts from other reasonably foreseeable future actions. Therefore, these elements of the environment are only discussed briefly below.

5.5.1 Transportation

The analysis of future traffic and transit impacts in Chapter 3 is a cumulative analysis based on the results of traffic modeling and ridership modeling that incorporate past, funded, and approved future actions, as well as projected growth that would result from development in the region.

Prior to construction of the project and under the No Build Alternative, I-90 is expected to operate with three general-purpose lanes and one high-occupancy vehicle (HOV) lane in each direction, and the reversible center roadway for use by HOVs and Mercer Island residents. For better traffic management, WSDOT is considering managing this roadway differently in the future, including tolling all lanes or adding tolls for single-occupant vehicle users of HOV lanes, known as high-occupancy toll (HOT) lanes. Tolling of SR 520 was assumed in all East Link transportation modeling, and tolling may also occur on other regional freeways, including I-90, I-5, and I-405, which could alter user behavior patterns further.

Exhibit 5-3 **Foreseeable Future Land Use Development Projects Segments B,C,D, and E**
East Link Project

As the East Link Project becomes operational, its contribution to cumulative impacts on transportation would be beneficial in at least two ways. First, East Link would contribute travel efficiencies in addition to those provided by the other reasonably foreseeable future transportation improvement projects listed in Appendix F5. The East Link Project would increase the number of person trips able to cross I-90 during peak periods compared to the No Build Alternative.

Both the No Build Alternative and the East Link Project assume tolling is implemented on SR 520 prior to 2020. This is consistent with the Supplemental Draft EIS for the SR 520 Bridge Replacement and HOV Project, which is the latest official document addressing the issue at this time. WSDOT is implementing a toll on SR 520 in 2011, before the bridge is replaced, as part of the Lake Washington Urban Partnership.

The Urban Partnership is a cooperative agreement between the federal government, WSDOT, King County, and PSRC to reduce congestion across Lake Washington. The Urban Partnership proposes to employ innovative traffic-management tools for improving traffic flow along SR 520 and I-90 between Seattle and the Eastside. One of these tools would be a new variable tolling system that could improve traffic flow in the SR 520 corridor and provide a portion of the funding needed to replace the aging SR 520 Lake Washington floating bridge.

Tolling on I-90 was not included in the traffic analysis for this Final EIS because no specific plans have been made or studies published. In 2008, the state legislature created the Tolling Implementation Committee to evaluate tolling for financing the SR 520 Bridge Replacement and HOV Project, engage citizens and regional leadership in the evaluation, enhance understanding of tolling alternatives, and report to the governor and state legislature in January 2009. Several of the scenarios considered tolling on I-90. If the State decides to implement tolling on I-90, it could choose to toll either all lanes of I-90 or convert the planned HOV lanes to HOT lanes. With tolling, the distribution of vehicles over all lanes may become more balanced, thus allowing higher travel speeds in all lanes and reducing congestion. Even with tolling, however, I-90 would be congested in the future, and overall person throughput would be equivalent to the No Build Alternative that is studied as part of the East Link Project analysis.

The project would also increase the person capacity of the corridor and would result in lower vehicle miles and fewer vehicle hours traveled within the corridor compared to the No Build Alternative. However, East Link, in conjunction with other reasonably foreseeable future actions, could increase congestion on some local streets, particularly in the vicinity of transit centers and park-and-ride lots. As discussed in Chapter 3, all but a few of these points of congestion can be mitigated.

During the 2- to 5-year period of civil construction, the East Link Project may add to and interact with construction impacts from other transportation projects being built at the same time (see Exhibit 5-1). Construction in or near roadways typically requires temporary lane closures, detours, and traffic delays. Interactions among two or more concurrent construction projects can intensify these impacts. However, most reasonably foreseeable future actions that can be reliably identified at present would be completed or near completion before East Link construction would begin.

The SR 520 Bridge Replacement and HOV Project will likely begin construction in 2012, and its construction period could overlap with East Link Project construction on I-90. Construction on SR 520 as well as the I-90 Two-Way Transit and HOV Operation affecting both Lake Washington corridors could cause cumulative traffic impacts on travel across the lake even without East Link Project construction. East Link construction would not affect traffic flow on I-90 outside of the center roadway. WSDOT and Sound Transit have been coordinating and would continue to coordinate on the construction schedules for the two cross-lake projects to avoid major construction work on both corridors at the same time.

This cumulative impact could slow or delay northbound and southbound traffic on I-405 during construction of a Segment C crossing of I-405, especially since it involves the I-405/SR 520 interchange about 2 miles east of the lake crossing.

Other local developments and public infrastructure projects could contribute to cumulative traffic delays on local arterial streets over the construction period. The City of Bellevue's NE 15th Street extension in the Bel-Red area might be constructed during a similar time period as the East Link Project; however, the East Link Project would more likely be constructed ahead of this roadway project. The disturbance on local traffic from the East Link Project could be minimal in the localized Spring District area, where the NE 15th Street project is located, because major portions of these lands are not fully used but are planned to transition to new, more dense land uses. However, construction of the NE 15th Street extension, the East Link Project, and possibly the Spring District development could occur under similar timeframes and cause a cumulative impact on traffic circulation outside the project vicinity based on the number of construction trucks on congested roadways leading to and from the construction site from the SR 520 and I-405 off ramps.

Outside of construction, the East Link Project in conjunction with other transportation projects would result in net benefit for improving accessibility and improved circulation. Following the selection, design, and scheduling of the East Link Project alternative, Sound Transit would coordinate construction activities with proponents of other future projects and with appropriate federal and state agencies and regional and local jurisdictions where other projects in the vicinity of East Link would be built at the same time. This coordination would avoid or minimize construction-related cumulative impacts on transportation.

5.5.2 Acquisitions, Displacements, and Relocations

The Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, contains requirements applied to projects involving federal funding or approval and therefore was assumed to be part of the project description, along with the State of Washington's relocation and property acquisition regulations (Washington Administrative Code [WAC] 468-100). Acquisitions related to private redevelopment projects in the project vicinity were not included in this evaluation because they involve willing buyers and sellers. Although environmental documents are not currently available for all reasonably foreseeable future actions shown in Exhibits 5-1 to 5-3, the Eastside could experience cumulative impacts from property acquisitions for major transportation projects, including the following:

- I-405 NE 8th Street to SR 520 Improvement Project would displace up to 61 businesses, 1 human service agency, and 3 residences.
- Transportation improvements related to the *Bel-Red Corridor Subarea Plan* (City of Bellevue, 2007), including extensions of NE 10th Street and NE 15th Street, and in Redmond the Bear Creek Extension, would collectively displace up to 39 buildings (a mixture of commercial buildings and residences). Bellevue's implementation of the NE 15th Street extension in the plan could result in modifications to the East Link alternatives in Segment D, which could affect the number of displacements.

Many of the areas where the East Link Project and other reasonably foreseeable future actions would be located are redeveloping to higher densities to accommodate the growing population and would provide increased housing and employment opportunities. Some of the planned development projects have slowed or halted recently due to a downturn in the economy; however, this slowed momentum might change in the period when East Link would be built. Both the Bellevue and Redmond comprehensive plans (City of Bellevue, 2008; City of Redmond, 2007) include policies that encourage mixed-use and higher-density redevelopment of the Bel-Red Corridor and the Overlake neighborhood. These redevelopments are expected to provide relocation opportunities within Redmond and Bellevue. Sound Transit's study of currently available properties to which displaced residents and businesses could relocate indicates that there are numerous comparable properties available within Redmond and Bellevue. Because there are expected to be more residential and employment opportunities created by projects in these areas than are lost, an adverse cumulative impact due to property acquisition is not expected.

5.5.3 Land Use

Changes in transportation systems can influence changes in nearby land uses, either directly through acquisition or indirectly by providing new or improved access. The East Link Project, as well as other planned transportation and development projects, would be consistent with applicable land use plans and policies. These projects would provide mobility options and would help achieve higher land use densities, thereby reducing the area of land development in ways that are consistent with regional and local plans and policies. Although density would increase without light rail, light rail would support more dense urban centers than would occur without light rail, particularly near stations in redevelopment areas.

The East Link Project would help achieve the goals of specific adopted plans, such as the *Bellevue Downtown Implementation and Subarea Plan, Bel-Red Corridor Project* (City of Bellevue, 2009), the *Overlake Neighborhood Plan Update* (City of Redmond, 2007), and the *Redmond Downtown Neighborhood Plan* (City of Redmond, 2006a), which encourage high-density, transit-oriented development. Land use changes would be greatest near rail stations due to increased transit accessibility and pedestrian activity, which are generally attractive to businesses and residents.

The East Link Project would require the acquisition of property and the conversion of existing land uses to public transportation right-of-way, which would reduce the amount of available land for development. The East Link Project, in conjunction with other planned projects in the project vicinity, would cumulatively contribute to this type of land use conversion. However, the land to be acquired by these projects constitutes a small fraction of the total residential, commercial, and public land in the project vicinity. In addition, these transportation projects would support high-density, mixed-use redevelopment, which would be a beneficial cumulative impact. Property acquired for construction staging areas and unused remnants of acquired parcels are expected to be available for redevelopment consistent with approved zoning following construction.

Although construction of the East Link Project and other planned projects would result in temporary impacts on existing land uses as a result of construction activities, such as earth-moving activities and truck traffic, these temporary impacts would not change the existing or future land use of the area.

5.5.4 Economics

The East Link Project would result in business displacements through acquisitions of commercial properties. Less than 1 percent of the study area's employment would be affected by business relocations. In addition, the areas that would be affected are primarily areas targeted for redevelopment. Other planned projects would also displace businesses and jobs within the project vicinity. It is likely that most of the displaced businesses could relocate in Bellevue and Redmond. Furthermore, planned private development projects would add jobs to the local economy, and denser, more diverse development could increase property and sales tax revenue for local jurisdictions. Therefore, East Link and other reasonably foreseeable future actions in the project vicinity have the potential to stimulate economic growth and provide a beneficial cumulative impact.

Additionally, under the No Build Alternative, travel times on the I-90 floating bridge are expected to increase by 2030. The East Link Project is expected to result in a net decrease in travel times on the bridge (by 2030, travel times are expected to improve or stay the same as current travel times for most directions at most times of the day), thus benefiting freight movement. In addition, the East Link Project together with other planned transportation projects would generally result in lower vehicle miles and fewer vehicle hours traveled on most arterial streets within the corridor. These improvements are expected to be beneficial for freight mobility, with associated benefits for the local and regional economy.

Construction activity is commonly an economic indicator, in that more construction is consistent with a stronger economy. Construction of infrastructure and development brings jobs and money to the local economy. Temporary adverse impacts of construction on adjacent businesses would occur, including potential increases in noise and dust, traffic congestion, visual intrusion, and difficulty in accessing properties. Access restrictions would be expected for some businesses in Segment C during the construction of cut-and-cover tunnels and stations and potentially in Segment D for retained-cut construction. Adverse construction-related cumulative impacts would be greatest where multiple projects would be under construction in the same areas, primarily in the Downtown Bellevue, Bel-Red, and Overlake growth centers.

The Bellevue Downtown Implementation Plan, Bel-Red Subarea Plan, and Overlake Village Neighborhood Plan allow continued execution of new private development projects. Although these projects will mostly occur on private property, construction might affect adjacent parcels and roadways and result in changes in access or local traffic circulation. Visitors might choose to avoid areas of intense construction, thus adversely affecting area businesses and contributing to a temporary cumulative impact, but following construction a more permanent beneficial impact would occur. Sound Transit has proposed to work closely with affected businesses during construction to maintain necessary access and facilitate positive communication for continued business activities through construction.

5.5.5 Social Impacts, Community Facilities, and Neighborhoods

In general, neighborhoods served by light rail would benefit both from increased transit access and from potential development within station areas. The East Link Project, in conjunction with other projects related to transit-oriented development, would result in primarily beneficial cumulative impacts on neighborhoods. Neighborhoods (particularly those portions near stations) may benefit from increased vitality in terms of improved access, residential infill, growth in employment base, and greater patronage of local businesses. In many neighborhoods, including Rainier Valley, South Bellevue, Downtown Bellevue, and Downtown Redmond, East Link and other transportation improvement projects would collectively enhance access options and reduce travel time for regional destinations.

Construction of the East Link Project and other planned projects could result in temporary adverse cumulative impacts on neighborhoods and social facilities. Cumulative impacts could include temporary increases in traffic through the neighborhoods, changes in traffic patterns, and construction noise and dust. Construction activities can hinder access to and from neighborhoods due to increased congestion, detours, and lane or road closures. These impacts would be greatest if several projects nearby were constructed at the same time, such as in the Bel-Red area where the Cities of Bellevue and Redmond have adopted land use plan changes and private development might occur at the same time as the East Link Project construction. The pedestrian/bicycle bridges at Overlake Village and Transit Center stations would collectively increase accessibility to surrounding neighborhoods with the light rail stations.

In Segment C, there is a foreseeable housing project that would be adjacent to the *110th NE Elevated Alternative (C8E)*, but is not anticipated to result in any negative impacts. The Low Income Housing Institute is planning to construct a low-income housing development in Downtown Bellevue. The guideway for C8E would be adjacent to the building, but would not require any property acquisitions that affect the development. No other Segment C alternatives would affect this development.

The East Link Project's contribution to cumulative impacts would be less likely in Segments A, B, and E. In Segments A and B, there are no anticipated foreseeable future projects occurring at the same time as East Link. In Segment E, East Link would not be constructed as part of the Sound Transit 2 Plan (ST2).

5.5.6 Visual and Aesthetic Resources

The East Link Project and other reasonably foreseeable future projects would be consistent with applicable plans and policies related to the visual environment. The cumulative change would be a more densely developed urban environment in all areas except Segment B.

Where land use policies permit, the visual change resulting from reasonably foreseeable future actions together with the East Link Project stations would likely include changes in development density and more pedestrian-oriented activity than with existing or no-build conditions. At the stations, primarily in Overlake and the Bel-Red corridor, East Link facilities would be more compatible visually than the existing light industrial land uses because future developments are intended to be transit-oriented, including higher density.

With few exceptions, the East Link Project would be visually compatible with the large arterials and freeways that it parallels. Improvements to several of these roadways are included as foreseeable future actions, such as the I-405 NE 8th Street to SR 520 Improvement, SR 520 East Lake Sammamish to SR 202, NE 10th Street Extension, and I-90 Two-Way Transit and HOV Operations Projects. Although these projects include visual enhancements, they would incrementally enlarge the area of transportation-dedicated land, especially when positioned adjacent to one another. This cumulative impact would decrease the visual quality along these transportation corridors. This decrease in visual quality would occur along some alternative routes in Segments B, C, and E.

In addition to becoming a part of the viewed environment, these infrastructure projects would provide new viewing opportunities for travelers. Depending on the combination of alternatives that would be chosen, the East Link Project would provide new and unique views of the adjacent landscape of the areas it would traverse. It would also help encourage denser development, which could help reduce regional impacts on the visual environment associated with low-density development (e.g., loss of open space, reduction in vegetated areas, or expansion of paved areas).

The East Link Project could contribute to cumulative impacts on the visual environment related to proximity impacts during construction if other planned projects are being constructed at the same time. Construction-related activities would increase the overall impacts on the surrounding visual environment.

5.5.7 Air Quality and Greenhouse Gases

The impact analysis for air quality in Section 4.6 was necessarily a cumulative analysis because it was based on the Puget Sound regional traffic forecasts, which include reasonably foreseeable transportation projects and projected regional emissions. The air quality analysis concludes that the East Link Project would reduce the cumulative release of car exhaust emissions to below future levels expected under the No Build Alternative, thereby providing a net benefit to local and regional air quality compared to the No Build Alternative.

One important component of air quality analysis is a project's contribution to the greenhouse gas (GHG) effect. GHGs contribute to climate change or global warming, which is an increase in the overall average temperature in the atmosphere. Global warming is a regional and ultimately a worldwide concern. Effects of the global warming trend are linked to more severe weather conditions, such as warmer temperatures and increases in flooding and tornados. Global warming might lead to a rise in sea levels and can change sensitive ecosystems. People may feel the effects of global warming as increasing smog conditions, stronger sun exposures, and economic impacts caused by changes in growing seasons (Washington State Department of Ecology [Ecology] and University of Washington Climate Impacts Group, 2008; King County, 2007).

Petroleum fuels are considered one of the largest contributors of GHG emissions. Any process that burns fossil fuel releases carbon dioxide (CO_2), the primary GHG, into the air. Two of the largest contributors to GHG emissions are transportation and energy production, although residences, offices, and industries contribute as well. Generally, improving fuel efficiency, reducing the burning of fossil fuels, conserving energy, and using clean energy instead of combustible sources are methods of improving GHG effects.

The East Link Project is part of the ST2. In addition to East Link, this plan would extend light rail north and south of the Initial Link Segment and make several other transit improvements throughout the central Puget Sound region. East Link, alone and as part of ST2, in conjunction with other reasonably foreseeable future land use development and transportation projects, would result in reduced automotive vehicle miles traveled for the Puget Sound region and, therefore, less petroleum consumed in the region.

Sound Transit has conducted a cumulative analysis on how the operation of ST2 would affect GHG emissions throughout the region compared to the No Build Alternative. ST2 is predicted to reduce overall regional CO_2 equivalent (CO_2e) by approximately 28,835 metric tons annually using current electric power fuel mix assumptions. Under the possible scenario of using noncarbon energy sources, the reduction could be as much as 178,334 metric tons—the equivalent of 414,731 barrels of oil a year, 931 railcars of coal a year, or preserving 1,244 acres of forest from deforestation (Sound Transit, 2008).

The reduction of vehicle miles traveled due to transit, in combination with increased densities in land use, is demonstrated through other cities' experiences. A recent publication by the Transit Cooperative Research Program, *Effects of TOD on Housing, Parking and Travel, Report 128* (2008) shows that throughout the nation, transit-oriented development is reducing automobile trips approximately 30 to 60 percent from typical suburban-style development patterns where uses are low density and separated from each other. Important variables in the study were housing density and distance to central business districts (the equivalent of "Urban Centers" for East Link). Generally, the higher the density and the closer (under 12 miles) to the central business district, the fewer automobile trips and more transit or nonmotorized trips were taken, leading to a cumulative benefit of reducing GHG emissions.

Improving automotive speeds up to 45 miles per hour reduces the GHG emissions compared to automobiles that are idling or moving at slow speeds due to traffic congestion (Urban Land Institute, 2008). East Link and other transportation improvement projects in the study area would cumulatively improve travel speeds for automotive travel as compared to the No Build Alternative in 2030.

While all of the ST2 projects would expend energy to build and develop, the long-term operation of these projects would be an improvement over low-density growth patterns that use more land area, thus requiring longer vehicle trips and more energy consumption.

Secondary impacts of the East Link Project, together with many of the reasonably foreseeable higher-density development projects identified for this EIS analysis, would result in a net benefit in GHG emissions over the No Build Alternative. Cumulatively, the East Link Project may result in greater unquantifiable benefits of reducing GHG emissions in the long term. Light rail projects, under the right conditions, can result in higher concentrations of employment and housing developments than if the project did not exist, especially near stations (see land use discussion, Section 5.5.3). Denser developments generally have lower per unit energy consumptions and, depending on the availability of services nearby, can result in fewer vehicle trips, which in turn results in lower GHG emissions over the equivalent lower-density employment and housing developments.

In addition, regional, state, and federal governments are adopting new regulations that will require reductions in GHG emissions, including the following:

- In February 2007, Washington Governor Christine Gregoire issued Executive Order 07-02 requiring the Department of Ecology and the Department of Community, Trade and Economic Development to find ways to reduce GHG emissions and adapt to the future that climate change might create. As a follow-up, Ecology adopted Chapter 173-441 WAC, Reporting of Emissions of Greenhouse Gases, on December 1, 2010, to require that certain large facilities and transportation fuel suppliers track their GHG emissions for reporting to the Washington Department of Ecology beginning in January 2012.

- On May 3, 2007, the Washington legislature passed Senate Bill 6001, which, among other things, adopted Governor Gregoire's climate change goals into state law. The law aims to reduce GHG emissions in the state to 1990 levels by 2020, then further reduce emissions to 50 percent below 1990 levels by 2030, and reduce GHG emissions even further by 2050.
- On December 19, 2007, President George W. Bush signed into law the Clean Energy Act of 2007, which requires in part that automakers boost fleet-wide gas mileage to 35 miles per gallon (mpg) by 2020. The current corporate average fuel economy (CAFE) standard for cars, set in 1984, requires manufacturers to achieve an average of 27.5 miles per gallon, while a second CAFE standard requires an average of 22.2 mpg for light trucks such as minivans, sport utility vehicles, and pickups.

Cumulatively, these improvements may change the trends of global warming.

The cumulative GHG savings with project operation cannot be realized without expended energy during construction. East Link, together with reasonably foreseeable future projects, would increase GHG emissions during project construction.

5.5.8 Noise and Vibration

The Federal Transportation Administration's (FTA's) accepted methodology for noise and vibration analysis reflects both cumulative ambient noise conditions and project-specific noise and vibration impacts. Light rail noise, although less than noise from a typical diesel bus, may be distinguishable from other transportation noise because it moves through the area in periodic intervals and would include warning bells in some locations. In addition, the project might realign some roadways, resulting in traffic noise impacts. Noise impacts from light rail and/or traffic would occur in all segments before mitigation, and vibration impacts would occur in Segments B, C, and E. Sound Transit has a policy to mitigate associated noise and vibration impacts as reasonable. All East Link noise and most vibration impacts could be mitigated depending on the alternatives chosen. However, there could be residual vibration impacts in Segments C and E.

The BNSF Alternative (B7) noise analysis incorporated recent WSDOT widening of I-405 and its impacts. Sound walls are in place that minimize these noise impacts on adjacent receptors. Future I-405 widening projects that could cause potential cumulative impacts by increasing highway traffic volumes and its associated noise and/or moving travel lanes closer to sensitive receivers are assumed and discussed in Appendix A of Appendix H1 and were included in the transportation forecasts.

Future developments in Segment D could include construction of a new NE 15th Street roadway extension. This future roadway corridor does not currently contain nearby sensitive noise receptors. The Lake Bellevue Condominiums are too far away to be affected by the NE 15th Street extension. The only identified noise impact in Segment D would occur along the SR 520 Alternative (D5). The NE 15th Street extension would not affect the same area.

No other reasonably foreseeable future actions are expected to cause vibration impacts during project operation, so the few vibration impacts from the East Link Project would not cause a cumulative impact. Although Sound Transit is committed to mitigating project noise impacts, light rail would still create a new noise source and therefore would contribute to cumulative noise in the project corridor. In addition, the indirect impact of East Link attracting more development around rail stations may result in more intense urban activities in some station areas, therefore adding cumulative noise to the surroundings.

During construction, the East Link Project would contribute noise and vibration impacts along with other nearby transportation and private development construction projects, and cumulative impacts would be anticipated. This is particularly true for the tunnel alternatives in Segment C, where construction of high-rise buildings is proposed near East Link alternatives, but many projects currently planned might be completed before East Link construction. Where necessary, Sound Transit would monitor noise and vibration during construction to minimize related disturbances on residential and other sensitive areas and work with other adjacent projects to limit nighttime noise and vibration impacts.

5.5.9 Ecosystem Resources

As discussed in Section 5.3, the study area and surrounding vicinity have greatly changed over time due to past actions and development. There are only a few high-value fish and wildlife habitats remaining within the study area: Lake Washington, Mercer Slough Nature Park, Marymoor Park, the Sammamish River, Bear Creek, and several small streams and tributaries. These areas provide habitat for fish and wildlife, including federally listed threatened and endangered fish species and several federal and state species of concern, particularly birds. Reasonably foreseeable future actions that would affect these habitats incrementally contribute to the loss and/or degradation of these high-value habitats and adverse impacts on associated wildlife.

Several planned transportation projects, such as the SR 520 Bridge Replacement and HOV Project, the I-405 Bellevue Nickel Project, Bellevue's Downtown Implementation Plan, and SR 520 West Lake Sammamish to SR 202 Project, could contribute to cumulative impacts on high-value uplands and wetlands in the study area in conjunction with the East Link Project alternatives. Adverse impacts would include removing large trees, filling or altering wetland habitat, and increased impervious surfaces in the project vicinity. These changes, along with additional urban development, continue to reduce remaining available high-quality nesting and foraging areas for present wildlife species. These projects also have the potential to contribute to cumulative impacts on aquatic resources, including disturbance to stream channels, removal of riparian habitat, and increases in pollution-generating impervious surfaces.

Positive impacts include efforts to enhance the Bear Creek and Kelsey Creek watersheds that cross through and extend beyond the East Link Project vicinity. The Cities of Redmond and Bellevue have adopted plans to enhance stream habitat. The City of Bellevue has adopted the Bel-Red Plan, which has an element devoted to "The Great Streams Strategy." This strategy involves stream enhancements that include removing culverts where possible, removing impassable fish barriers, planting riparian vegetation along stream banks, and generally improving stream quality. These efforts are focused on Goff Creek and the West Tributary of Kelsey Creek, both of which are located in Segment D and cross Mercer Slough Nature Park in Segment B. Also, the City of Redmond has a stream enhancement project north of SR 520 on Bear Creek in Segment E.

In addition to these projects, other state-permitted and locally permitted projects incrementally provide net benefit to stream suitability for fish. When a project affects a stream, the Washington State Department of Fish and Wildlife and the Washington Hydraulic Code requires that impacts on fish and fish habitat be minimized and mitigated. The code also requires that new and replaced culverts be designed and installed so as not to impede fish passage.

The East Link Project and other reasonably foreseeable future actions would be required to mitigate impacts on streams, wetlands, and high-value habitats in accordance with federal, state, and local regulations. Mitigation may include restoration or enhancement of degraded streams and wetlands and their associated buffers, thus providing water quality treatment for impervious surfaces that currently receive no treatment, removal of fish passage barriers, and planting disturbed areas with native vegetation. These mitigation measures benefit fish and wildlife habitat when compared to existing conditions and improve conditions for federally listed threatened or endangered species, if present. Also, with regard to wetland impacts, Sound Transit has committed to achieving no net loss of wetland function and area on a projectwide basis and, therefore, would not have a lasting cumulative impact on wetlands.

Construction associated with the East Link Project and other foreseeable future transportation and development projects would temporarily contribute to habitat loss resulting from vegetation removal for construction staging areas and access. Stream water quality could be affected by erosion and sedimentation from cleared areas and earth-moving activities. Each project would be required to comply with water quality protection regulations during construction. After construction, cleared areas would be revegetated.

5.5.10 Water Resources

The East Link Project and many of the foreseeable projects would add new impervious surface. Although many of the actions would be on currently developed sites or would be changes within existing paved rights-of-way, there would still be a net increase in total impervious surface and therefore an increase in stormwater runoff within the study area above existing conditions.

Light rail vehicles have been determined by Ecology to be clean, or noncontributors of contaminants into stormwater runoff. New impervious surfaces added by the East Link Project and other reasonably foreseeable future actions would include appropriate stormwater control and quality treatment in accordance with Ecology regulations. This mitigation would improve the treatment of some existing stormwater drainages and thus provide an overall cumulative benefit for water quality.

The cumulative impacts of other reasonably foreseeable future actions may increase the number of vehicles operating on impervious surfaces, resulting in the release of petroleum-related contaminants into stormwater runoff. East Link would reduce peak traffic loads from those projected under the No Build Alternative, thereby reducing some of the cumulative contaminant runoff from impervious surfaces. In summary, East Link would provide a direct beneficial cumulative impact related to impervious surfaces.

The East Link Project could contribute to cumulative turbidity and sedimentation in receiving streams during construction, if any of the other nearby planned projects were being constructed at the same time. However, as part of a stormwater pollution prevention plan (SWPPP), Sound Transit is required to prepare and implement a Temporary Erosion and Sediment Control Plan and a water quality monitoring plan to minimize these impacts.

5.5.11 Energy

Reasonably foreseeable future actions would increase energy demand in the project vicinity. In terms of energy used for transportation, the operation of the East Link Project would decrease total energy consumption when compared to the No Build Alternative because the total vehicle miles traveled would decrease and the energy needed to power the East Link Project would be less than the vehicles it is replacing.

The East Link Project would also require energy to run the proposed maintenance facility. However, this facility is proposed to be built on redeveloped properties; therefore, it is unlikely that the change in use would draw more energy than currently used at these sites.

There would be a cumulative demand on energy during construction. However, both Puget Sound Energy and Seattle City Light growth projections resemble PSRC's long-term demand projections, and these utilities have planned energy resources accordingly; therefore, this planned growth is not expected to have an impact on energy resources (Puget Sound Energy, 2010; Seattle City Light, 2010). As with most construction projects, the energy used would be lost. But unlike other projects, the cumulative transportation energy savings would compensate for the construction energy use over time.

5.5.12 Geology and Soils

Existing urban development has already substantially altered geologic surface conditions throughout the East Link Project vicinity. Continued development associated with the reasonably foreseeable future actions would increase the amount of infrastructure placed in localized geologically sensitive areas such as steep slopes or seismic hazard areas. However, all projects must be constructed in accordance with state and local laws that require design and construction to meet seismic standards; therefore, a cumulative impact is not expected in operation or construction of reasonably foreseeable projects.

5.5.13 Hazardous Materials

Lubricants, cleaning solvents, and other chemicals would be used at the proposed maintenance facility; however, hazardous wastes generated at the facility would be managed according to applicable regulatory requirements, which minimize the risk of exposure, and the likelihood of impacts (i.e., releases) from operation and maintenance activities would be low. Otherwise, East Link would not result in risks of spilling hazardous materials during project operation.

During construction, the project and all reasonably foreseeable future actions have the potential for an accidental release of hazardous substances. Sound Transit and other project proponents would implement measures to minimize this potential during construction and would document these measures in a Spill Prevention, Control, and Countermeasures plan; a comprehensive hazardous substances management plan; and an SWPPP. With implementation of these measures, the risk of cumulative hazardous materials impacts would be low.

Construction of any project could also encounter or disturb previously unknown contamination that has not been controlled or cleaned up. Disturbing contaminated soil and/or groundwater has the potential to release contaminants into the environment where they could pose additional risk to human health and the environment. East Link, along with other reasonably foreseeable future actions in the project vicinity, is likely to result in improved environmental quality by uncovering and removing existing soil and water contaminants. All project development would require the remediation of any contaminated sites encountered in compliance with state and federal environmental regulations. Therefore, the East Link Project would be a beneficial cumulative impact in the study area compared to existing conditions and the No Build Alternative.

5.5.14 Electromagnetic Fields

East Link would not result in electromagnetic interference (EMI) that causes sensitive electronic equipment to malfunction. In addition, Sound Transit did not identify any areas where EMI would combine with past, present, or future actions to result in human health effects. Therefore no EMI cumulative impacts would result from East Link.

Anywhere there are electrical currents, it is possible that stray currents could affect metal, water, or buried pipe or cable. Impacts such as corrosion of metal pipes could occur from the East Link Project and from any number of other current-generating sources. Sound Transit would use insulation to limit stray currents from the East Link Project and their potential impacts on nearby utilities.

5.5.15 Public Services

As the regional population has increased, so has the demand for public services. Demand for these services will continue to increase with the expected growth in regional population. The East Link Project would not itself add growth but would facilitate planned growth. Existing services and those intended to serve this planned growth would be available for users of a Sound Transit facility, including police and emergency service personnel. In addition, Sound Transit would provide security services dedicated to surveillance throughout the light rail system to minimize crime incidents.

East Link would be built in a dedicated right-of-way where collisions with other vehicles could not occur except in the few alternatives where conflicts with traffic at signalized intersections, gated crossings, or egresses and ingresses would be possible. If those alternatives were selected, Sound Transit would coordinate with local emergency service personnel on how to respond to accidents with other vehicles.

The East Link Project, together with other reasonably foreseeable future actions, would alter roadway infrastructure, which would both improve and alter emergency service travel routes. Specifically, the conversion of the I-90 center roadway to East Link right-of-way would limit emergency services to the outer lanes, including the available HOV lanes. However, as discussed in Chapter 3, Transportation Environment and Consequences, congestion periods would be less with the project than without, and emergency response times would be similar to or better than would be expected under the No Build Alternative.

As noted in the project description in Chapter 2, Sound Transit would coordinate with public service agencies regarding construction of the East Link Project and other proposed developments being built at the same time, thereby minimizing cumulative construction-related impacts on emergency response services.

5.5.16 Utilities

The East Link Project and other reasonably foreseeable future actions would increase the demand for electrical power. While a portion of the power needed for East Link would come from Seattle City Light, the East Link alternatives are primarily located in the Puget Sound Energy service area and most of the power needs would be sought through Puget Sound Energy. East Link would represent less than one-third of one percent (0.3 percent) of Seattle City Light and Puget Sound Energy’s yearly production in 2009, and system upgrades are planned to allow these utilities to meet the total projected demand in 2030. Development of additional generating capacity beyond what is currently planned by these providers is not expected in order to accommodate East Link and other reasonably foreseeable future actions (Puget Sound Energy, 2010; Seattle City Light, 2010).

Utility infrastructure in the project limits, such as electric, water, sewer, gas, petroleum, or communications service lines, that would conflict with any of the project alternatives would be relocated before or during project construction. Other reasonably foreseeable future actions in the project vicinity would also be responsible for providing similar relocations where utility conflicts occur.

Cumulative construction-related impacts could occur when projects that are constructed before East Link, such as the I-405 Bellevue Nickel Project and the Redmond Central Connector Project, relocate utilities in areas that create new conflicts for the East Link alternatives. These situations would be minimized through advance construction coordination with utility providers. In many cases, relocation of utilities would provide utility providers a cost-effective opportunity to upgrade infrastructure, thereby reducing maintenance costs and resulting in a beneficial cumulative impact.

5.5.17 Historic and Archaeological Resources

Reasonably foreseeable future actions in the project vicinity would have no direct impacts on specific historic or archaeological resources in the East Link Project study area. However, cumulatively, the past, present, and future projects affect historic properties and archaeological resources. Incrementally, new infrastructure and development patterns change the historic setting of specific resources as a result of past and ongoing urbanization, particularly in Bellevue and Redmond.

East Link could affect the Winters House and the potential Surrey Downs historic district in Bellevue and the Justice William White House in Redmond. The settings surrounding these structures have already been altered by the development, increasing traffic conditions, and changes of uses surrounding them. Incrementally, East Link is part of the changing fabric of urbanization. In this regard, there is an incremental cumulative impact on historic resources. No direct or indirect impacts on archaeological resources are expected; therefore, no cumulative impact is expected.

5.5.18 Parkland and Open Space

The East Link Project would not result in a net loss of parkland and open space after mitigation. The only identified reasonably foreseeable future actions that might alter or affect park resources within the East Link Project vicinity are the Surrey Downs Park Master Plan in Segment B and the Redmond Central Connector Project in Segment E. The City of Bellevue has plans to redesign the park to better serve the community by enhancing Surrey Downs Park and potentially add new park facilities. The City of Redmond is working with King County to develop the regional trail within the former BNSF Railway corridor. Redmond is also planning subsurface utilities as well as the potential for future rail in the same corridor. The planning would result in a cumulative benefit for trail development.

In combination with the other foreseeable projects, the East Link Project could potentially cause cumulative impacts on parklands if construction periods overlap. In Segment B, the East Link Project could have temporary construction impacts on the Surrey Downs Park Master Plan if construction of the project occurs before or during construction of light rail.

In Segment E, the Redmond Central Connector Project is anticipated to be completed prior to construction of the East Link Project. However, construction activities associated with light rail would have temporary construction impacts such as increased noise, dust, and access limitations for users of the trail. Due to inconsistencies between the City of Redmond’s Central Connector Master Plan and the East Link route through Downtown Redmond, implementation of East Link in the future could result in relocation of the trail and/or replacement of affected trail amenities.

5.5.19 Potential Mitigation Measures for Cumulative Impacts

Operational cumulative transportation, visual, noise, ecosystem, and water resource impacts could occur. Avoidance, minimization, and mitigation measures for East Link Project operation impacts on these and all resources are discussed in Chapters 3 and 4. However, most cumulative impacts would occur during construction rather than project operation, so that in most cases mitigation would remain the responsibility of each project proponent in order to meet regulatory requirements during construction for direct impacts on resources such as ecosystems, water resources, hazardous materials, and historic and archaeological resources.

The reasonably foreseeable future projects that would be under construction at the same time as East Link would coordinate, as necessary, to minimize the potential cumulative impacts of overlapping construction periods within the same area. Such coordination would reduce cumulative construction impacts related to transportation, reduced access, and increased dust and noise affecting businesses and residences, visual resources, reduced emergency service response times, and park uses.

Chapter 6

Alternatives Evaluation

This chapter evaluates how East Link would meet the project Purpose and Need, and analyzes the benefits, environmental impacts, and cost-effectiveness of the project as well as each segment alternative.

The Purpose and Need for the East Link Project, as discussed in Chapter 1, is to expand the Sound Transit Link light rail system from Seattle to Mercer Island, Bellevue, and Redmond via Interstate 90 (I-90) in order to provide a reliable and efficient alternative for moving people to the Eastside of Lake Washington and throughout the region. To meet this Purpose and Need, the East Link Project would be a composite of one alternative from each of the five geographic segments connecting Seattle with Mercer Island, Bellevue, Overlake, and Redmond.

In addition, the East Link Project is one of several proposed light rail expansions to Central Link, the north-south light rail project in Seattle, Tukwila, and SeaTac. Collectively, the system would have benefits greater than the individual projects. Several of these benefits are also described in this section.

6.1 Performance in Meeting Project Goals and Objectives

The goals and objectives for the East Link Project are described in Chapter 1 and form the basis for the evaluation of alternatives presented in this chapter. These goals and objectives include the following:

1. Transportation goal: Improve transit mobility in the East Link corridor
    a. Improve the quality of transit service
    b. Increase transit accessibility
    c. Maximize East Link ridership
2. Environmental goal: Preserve environmental quality in the corridor
    a. Minimize potential adverse operating impacts on the natural and built environments
    b. Minimize potential adverse construction impacts on the natural and built environments
3. Land use goal: Support regional and local land use goals and objectives
    a. Support adopted land use and transportation plans
4. Implementation goal: Minimize risk in the corridor
    a. Enhance stakeholder and community support
    b. Design system to reduce construction risk
5. Financial Goal: Provide a financially feasible solution
    a. Build a system within project budget
    b. Build a system that can be operated and maintained within available revenue
    c. Build a system that is cost-effective

This chapter evaluates the entire project and the individual alternatives related to each goal. The project's performance in meeting some project goals and objectives would be similar for all build alternatives. For example, any build alternative would enhance transit accessibility and provide transit quality in terms of comfort and reliability of service. The data used to assess how the East Link Project and the segment alternatives meet these goals are taken from earlier chapters of this Final Environmental Impact Statement (EIS), namely Chapter 2 for project cost information, Chapter 3 for transportation-related topics, and Chapter 4 for environmental and land use goals. The risk assessment discussed in this chapter is based on both cost and construction risks. The data are used in the following subsections to compare the various alternatives.

6.1.1 Transportation Goal: Improving Mobility

The East Link Project would improve mobility into and out of many of the urban centers with the highest populations and highest levels of employment in the Puget Sound region (Seattle, Bellevue, Overlake, and Redmond). East Link would provide easy access throughout the project area and other key regional urban centers through seamless extension of Central Link, which began operation in July 2009 in the greater Seattle area. This subsection describes how the project would accomplish the following:

- Improve the quality of transit service
- Increase transit accessibility
- Maximize East Link ridership

Table 6-1 summarizes the transportation characteristics of the project alternatives.

TABLE 6-1
Summary of East Link Alternatives

Segment	Alternative	No. of Stations	Segment Daily Boardings (2030)[a]	East Link Daily Ridership Totals (2030)[a]	Segment Travel Time (minutes)
A, Interstate 90	*Preferred I-90 Alternative (A1)*	2	5,000	49,500	11
B, South Bellevue	*Preferred 112th SE Modified Alternative (B2M)*	1 to 2	5,000	49,000	5
	Bellevue Way Alternative (B1)	1	4,500	52,500	5
	112th SE At-Grade Alternative (B2A)	2	5,000	49,000	5
	112th SE Elevated Alternative (B2E)	2	5,000	50,000	5
	112th SE Bypass Alternative (B3)[b]	1	4,500	49,500	5
	BNSF Alternative (B7)	1	1,500	48,000	5
C, Downtown Bellevue	*Preferred 108th NE At-Grade Alternative (C11A)*	3	8,000	49,000	10
	Preferred 110th NE Tunnel Alternative (C9T)	2 to 3	8,000	51,000	6
	Bellevue Way Tunnel Alternative (C1T)	3	9,000	52,500	5
	106th NE Tunnel Alternative (C2T)	2 to 3	8,500	52,000	5
	108th NE Tunnel Alternative (C3T)	2 to 3	9,000	52,500	4
	At-Grade Couplet Alternative (C4A)	2 to 3	8,000	49,500	11
	112th NE Elevated Alternative (C7E)	2 to 3	7,000	50,500	4
	110th NE Elevated Alternative (C8E)	2 to 3	8,000	51,500	4
	110th NE At-Grade Alternative (C9A)	2 to 3	7,500	48,500	9
	114th NE Elevated Alternative (C14E)	2	5,500	48,500	4
D, Bel-Red/ Overlake	*Preferred NE 16th At-Grade Alternative (D2A)*[c]	3 to 4	7,000 (7,000)	51,000 (49,500)	8 (10)
	NE 16th Elevated Alternative (D2E)	3 to 4	7,000	50,000	9
	NE 20th Alternative (D3)	3 to 4	6,500	49,000	10
	SR 520 Alternative (D5)	2	6,000	49,500	7
E, Downtown Redmond	*Preferred Marymoor Alternative (E2)*[d]	2 (3)	3,500 (4,000)	49,500 (50,000)	6
	Redmond Way Alternative (E1)	2	3,500	49,500	6
	Leary Way Alternative (E4)	2	3,500	50,000	6

[a] Ridership reported for each alternative is based on the representative East Link route (a combination of Alternatives *A1*, B3, C4A, *D2A*, and *E2)*. See Chapter 3, Transportation Environment and Consequences, for additional ridership information including the ridership exclusively prepared for the *Preferred Alternative* in each segment.

[b] Daily boardings, ridership, and travel time are the same with B3 – 114th Extension Design Option.

[c] Daily boardings, ridership, and travel time in parenthesis are for the D2A – NE 24th Design Option. The daily boarding, ridership, and travel time for the D2A – 120th Station Design Option would be similar to *Preferred Alternative D2A*.

[d] Daily boardings, ridership, and travel time in parenthesis are for the E2 - Redmond Transit Center Design Option.

6.1.1.1 Transit Quality

The East Link Project would provide a comfortable, high-capacity transit (HCT) service that would increase reliability of the regional transit system and result in substantial time savings for all travel modes. Current bus service reliability is poor and is projected to remain poor into the future in spite of infrastructure investments to improve high occupancy vehicle travel. This is because congestion on the arterial and highway systems will continue to influence transit service dependability. The East Link Project would improve transit quality in the region by providing frequent and reliable HCT service 20 hours each day in the Seattle, Mercer Island, and Bellevue to Redmond corridors (18 hours on Sundays). East Link passengers would benefit from a comfortable ride; high-person capacity;

efficient loading of multiple-car trains resulting in short in-station loading time; and dependable, on-time departures and arrival.

The project would use dedicated right-of-way, thus allowing East Link to operate reliably, independent of congested roadway conditions. The project is planned to operate during the peak periods with a train-arrival frequency (i.e., headway) of every 7 minutes by 2030. The project is designed to operate up to four-car trains. Ultimately, the project could carry 600 persons per four-car train comfortably and 800 persons during crowded conditions with 4-minute headways; this would more than double the person-carrying capacity of I-90 because East Link could carry 18,000 to 24,000 people (9,000 to 12,000 per direction) during the peak period. This is the equivalent of about 7 to 10 freeway lanes of traffic (assuming that automobiles in the Puget Sound region average 1.17 persons per vehicle during commute hours, or about 2,300 persons per hour per freeway lane).

This capacity would provide a robust “backbone” of service feeding a network of bus distribution and feeder routes. As a dedicated right-of-way system, East Link would provide reliable, frequent service through highly congested roadways to feed multiple bus lines, thereby collectively reaching a broad range of destinations in a timelier manner than the No Build Alternative. The East Link Project analysis estimates that light rail travel between Seattle and Downtown Bellevue would take less than 20 minutes, and between Seattle and Downtown Redmond, between 29 to 39 minutes, regardless of time of day or level of traffic congestion. This would be a savings of up to 25 minutes compared to an automobile currently traveling between these locations in the afternoon peak period. It can currently take up to 45 minutes to travel between Seattle and Bellevue (via I-90) and up to 55 minutes to travel between Seattle and Redmond (via SR 520) (Washington State Department of Transportation [WSDOT], 2011). These times are expected to continue to worsen, and therefore light rail would provide an even greater travel-time savings. Without the East Link Project, it is expected that bus reliability in the future would continue operating at a failing level. East Link Project reliability would provide the highest transit service level.

The Sound Transit Ridership Model was used to calculate the travel-time savings with transit trips in the afternoon (PM) travel period. Average transit travel time is the time it takes riders to travel from door to door (i.e., from the front door of their home to the front door of their work) by a composite of modes (i.e., auto, bus, bicycle, pedestrian, and light rail). Compared to the No Build Alternative, the average door-to-door peak-period transit travel time using light rail would be between 4 and 16 minutes faster to a given East Link destination. The results of the transit travel-time savings analysis for people who reside in the East Link study area are summarized in Table 6-2, which provides a range of minute savings by station.

6.1.1.2 Transit Accessibility

The East Link Project would enhance accessibility and integration of transportation modes by creating between 10 and 13 stations with connections to local bus systems and park-and-ride options. While the population in the project vicinity has increased substantially since the 2000 U.S. Census, 2000 Census data show that the project would enhance access for more than 5,000 low-income and more than 9,000 minority residents who live within one-half mile of proposed stations. The low-floor cars that would be used for East Link provide convenient loading for patrons with disabilities. Additionally, the East Link Project would extend transit connections for riders to and from Central Link destinations. Central Link connects Downtown Seattle to the Seattle-Tacoma International Airport, with extensions to the University of Washington by 2016, north to Northgate by 2020-2021, and south to South 200th between 2015 and 2020, depending on funding.

TABLE 6-2
Average 2030 Door-to-Door Peak-Period Transit Travel Time Savings with East Link Compared to No Build Alternative

Segment	Station	Average Minutes Saved
A, Interstate 90	Rainier	7
	Mercer Island	9
B, South Bellevue	South Bellevue	7
	118th	12
	SE 8th	11
C, Downtown Bellevue	East Main	12
	108th	10
	Old Bellevue	9
	Bellevue Transit Center	8
	Hospital	9
	Ashwood/Hospital	8
D, Bel-Red/ Overlake	120th	8
	130th	6
	Overlake Village	7
	Overlake Transit Center	4
E, Downtown Redmond	SE Redmond	16
	Downtown Redmond	13
	Redmond Town Center	14
	Redmond Transit Center	10

The East Link Operation Plan includes direct service north to the University of Washington and Northgate without requiring a change of trains.

6.1.1.3 Ridership

Ridership projections vary among the segment alternatives. As a project providing service from Seattle to Redmond, East Link is projected to contribute between 48,000 and 52,500 rider trips per day to the Sound Transit light rail system by 2030. Chapter 3, Transportation Environment and Consequences, describes ridership differences among the alternatives. The following subsections summarize the relative variations in ridership among the alternatives.

Segment A

There are between 5,000 daily boardings forecast for *Preferred Interstate 90 Alternative (A1)*. These boardings would be for Rainier and Mercer Island Stations only. The International District/Chinatown Station boardings are not included.

Segment B

Preferred 112th SE Modified Alternative (B2M) would attract 49,000 riders. Other Segment B alternatives would attract a similar number of daily segment and overall project ridership (4,500 to 5,000 segment and 49,000 to 52,500 overall), except for the BNSF Alternative (B7), which would attract a substantially lower number of segment boardings (1,500) and 48,000 overall riders per day.

Segment C

There would be a wider spread of influence on daily boardings among alternatives within Segment C than the alternatives in Segment B. *Preferred 108th NE At-Grade Alternative (C11A)* would be similar to *Preferred 110th NE Tunnel Alternative (C9T)* in that they would both provide a segment ridership of 8,000. Overall projectwide ridership with *Preferred Alternative C9T* would be 51,000 versus 49,000 with *Preferred Alternative C11A*. The Bellevue Way (C1T) and 108th NE Tunnel (C3T) Alternatives have the potential to attract the highest daily boardings (ranging up to 9,000) within Segment C; these alternatives also produce the highest daily ridership for Segment C alternatives with 52,500. The 110th NE At-Grade Alternative (C9A) would have the lowest overall ridership along with the 114th NE Elevated Alternative (C14E) with 48,500. Alternative C14E is projected to attract the least number of segment boardings (5,500).

Segment D

Segment D alternatives would attract similar ridership (approximately 6,000 to 7,000 segment boardings), including the SR 520 Alternative (D5), which has two fewer station stops. This shows that the Overlake Transit Center Station has a large ridership potential even without the other proposed stations at 120thand 130th Avenues. The ridership model demonstrates that Alternative D5, with a faster travel time than other Segment D alternatives, would result in higher boardings at nearby stations in adjacent segments, and therefore would have a similar influence in overall projectwide ridership as the other Segment D alternatives but would not serve City of Bellevue’s planned high-density, transit-oriented land uses in the Bel-Red area.

*Preferred NE 16th At-Grade Alternative (*D2A) would provide the highest overall ridership (7,000 segment and 51,000 overall projectwide riders). However, D2A – NE 24th Design Option would have segment ridership of 7,000 segment riders and 49,500 overall projectwide riders. Alternative D3 would have the lowest number of projectwide riders, with 6,500 segment riders and 49,000 overall projectwide riders.

Both Bellevue and Redmond have adopted land use plans (in Bellevue for the Bel-Red area and Redmond for the Overlake Village area). These land use plans are assumed in the ridership model projections for Segment D. The projected land uses would consist of high-density residential and commercial mixed land uses concentrated around the proposed station locations (i.e., Ashwood/Hospital, 120th, 130th, and Overlake Village stations). The transportation model includes the proposed change in land uses.

Segment E

The ridership projections for Segment E do not reveal a strong difference in daily boardings among the alternatives. E2 - Redmond Transit Center Design Option, which would extend to the Redmond Transit Center, would provide one more station than the other alternatives and, therefore, more access but with only a slightly higher segment boardings (4,000) and similar overall projectwide ridership (50,000) as Leary Way Alternative (E4). *Preferred Marymoor Alternative (E2)* and Redmond Way Alternative (E1) provide 3,500 segment boardings and 49,500 overall projectwide riders.

6.1.2 Environmental Goal: Preserve Environmental Quality

The environmental goal is to preserve environmental quality in the project corridor. This goal would be met in the following ways:

- Minimize potential adverse operating impacts on the natural and built environments.

- Minimize potential adverse construction impacts on the natural and built environments.

6.1.2.1 Range of Impacts

All project alternatives would incorporate impact avoidance and minimization measures. Because of the highly urbanized nature of the project vicinity, most impacts would relate to the built environment. Impacts generally would concern transportation, property acquisition, visual and parks resources, and noise and vibration. Fewer impacts would affect natural resources, as demonstrated by the range of impacts summarized in Table 6-3. Most of the adverse impacts could be mitigated.

The East Link Project would also offer environmental improvements over the No Build Alternative. The project would result in net benefit to aquatic habitats and would remove contaminated soil along the project route. The construction process would bring economic benefit to the area by adding jobs and money spent in the region. After construction, the area surrounding several of the stations would be likely to attract transit-oriented development where additional capacity in land-use density is permitted. East Link would benefit the region by decreasing vehicle miles traveled (VMT) and vehicle hours traveled (VHT) by 0.2 percent, which would result in lower energy usage and would help reduce the overall volume of carbon dioxide emission into the region and, therefore, reduce greenhouse gas effects. Thus, the East Link Project is expected to preserve overall environmental quality.

Where applicable, Table 6-3 gives the range of the lowest and highest impacts for each impact category before mitigation measures are applied. As shown, many projectwide impacts before mitigation concern property acquisition, which is also reflected in relocating businesses and employees, removing parklands, and losing some wetlands. Operating East Link may also degrade some traffic intersections. After mitigation, only a few resources would be adversely affected by the project. Depending on the combination of alternatives, there may be some residual vibration impacts, visual quality reductions, and potentially permanent changes to McCormick Park.

Constructing the East Link Project would be about a 2- to 5-year process on a given portion of the route. During construction, traffic may be adversely affected, which can affect adjacent businesses. Construction could also result in dust, noise, and vibration, as well as lower visual quality around the construction site. There may be temporary impacts on wetlands and other habitats. Sound Transit is committed to replacing park lands, but during construction, park use would be limited in some construction areas. Construction of any of the alternatives could also result in increased employment and spending in the project vicinity during construction.

6.1.2.2 Environmental Impacts by Alternative

Table 6-4 summarizes the environmental impacts for each segment, focusing on the issues that differentiate alternatives within each segment. The categories may differ between segments because of the types of impacts occurring in each segment. A comparative description among alternatives within each segment follows for notable environmental impacts.

Segment A

Because *Preferred Alternative A1* is mostly located within the existing I-90 freeway, there would be few environmental impacts, which are summarized in Table 6-4. The primary impacts would be transportation-related. In comparison to the No Build Alternative (even with the implementation of the I-90 Two-Way High-Occupancy Vehicle [HOV] Transit and Operations Project), light rail would increase the total numbers of persons crossing I-90 during peak traffic hours. If the D2 Roadway (transit/ HOV access ramp from Seattle to I-90 center roadway) does not permit joint use of light rail and bus transit usage, then bus transit trips may lengthen by as much as 4 minutes. The project would result in increased congestion at up to three Mercer Island freeway ramps and worsen the operations at up to four arterial intersections, although these can be mitigated. Other environmental impacts include groundborne noise impacts on residential properties above the Mt. Baker Tunnel and the removal of landscaping where Sound Transit station entrances would be placed along Benvenuto Park in Seattle and in the Park-on-the-Lid in Mercer Island; both impacts would be mitigated.

Segment B

Table 6-4 summarizes Segment B impacts. All Segment B alternatives would cause impacts on the Mercer Slough Nature Park, but only the *Preferred Alternative B2M* would potentially impact the Winters House and temporarily close activities held at the Winters House and blueberry farm during construction. Alternative B7 would create a new crossing over the Mercer Slough Nature Park. *Preferred Alternative B2M* would require the most property acquisition in this park, specifically along its western edge. All Segment B Alternatives would result in long-term impacts on wetlands, although Alternative B7 would affect 1.9 acres and all other alternatives would affect substantially less than an acre. All impacts on Mercer Slough Nature Park and wetlands can be mitigated.

TABLE 6-3
Projectwide Range of Impacts by Impact Category

Impact Category		Low Potential Impact Range[a]	High Potential Impact Range[a]
Transportation	Number of intersections improved	2	6
	Number of intersections worsened (after mitigation)	9 (0)	20 (0)
	Number of parking spaces removed	288	1,439
Acquisitions, Relocations, and Displacements	Full property acquisitions	14	78
	Partial property acquisitions	84	236
	Total acres to be acquired	45.1	129.3
	Businesses displaced	54	156
	Residences displaced	2	229
Land Use	Consistent with relevant policies	Consistent	Not as consistent
	Potential to facilitate transit-oriented development	Low to moderate	Moderate to high
Economics	Employment displacements (estimated number of employees)	760	2,860
	Initial property tax impact (range of $ that would be removed from affected city property tax revenue)	$44,000	$252,000
Visual	Number of incidences where project may result in a decrease in visual quality	0	3
Air Quality and Greenhouse Gases	Savings in tons of carbon monoxide per year compared to the No Build Alternative (tons carbon monoxide/year)	1	3
	Hot spot analysis exceedances	0	0
	Greenhouse gas emissions annual decrease (carbon dioxide equivalent in metric tons)	18,980	25,915
	Greenhouse gas emissions during construction (carbon dioxide equivalent in metric tons)	94,893	173,197
Noise/Vibration	Traffic noise impacts (after mitigation)	0(0)	154 (0)
	Transit noise impacts (after mitigation)	203 (0)	943 (0)
	Vibration (after mitigation)	3(0)	11(3)
	Ground-borne noise (after mitigation)	25(0)	36 (0)
Ecosystems	Long-term impact on wetlands (acres)	0.3	2.6
	Impact on high-value (priority) habitat (acres)	1.7	6.0
	Impact on threatened/ endangered species	0	0
	Fish passage/habitat	No impact	Minor adverse impact
Water	Increase in impervious surface (acres)	16.2	34.9
	Floodplain impact	None	Minor
Energy	Savings in million British thermal units (MBtu)/year	907	1,217
Geology	Risk of causing a geologic hazard	Low risk	Medium risk
Hazardous Materials	Potential impacts on high-risk sites (number of sites)	8	19
Electromagnetic Field	Electromagnetic field interference	0	0
Utilities	Relocation	Low to high	Low to high
Historic Resources	Length of archaeological sensitive areas (miles of corridor)	4.5	13
	Potential to affect historical resources (number)	0	3
Parklands Impacts	Permanent	1.3	6.5
	Temporary	2.0	13.6
Construction Impacts	Noise, transportation delays and detours, economic impacts on businesses	Medium	High

Preferred Alternative B2M, Alternative B2E, and B3 -114th Extension Design Option would result in only one residential displacement. Alternative B1 would result in the highest number of residential displacements, whereas Alternative B3 -114th Design Option would displace the highest number of employees. All Segment B alternatives (except *Preferred Alternative B2M*) traveling along Bellevue Way SE would lower the visual quality of the area due to long-term changes to the west hillside.

Alternatives B1, B2A, and B3 would affect traffic operations at the 112th Avenue SE and Bellevue Way SE intersection, but the impacts can be mitigated. Likewise, Alternative B7 would affect traffic operations at two intersections along 118th Avenue SE and Coal Creek Parkway, but both of these intersections can be mitigated. All noise and vibration impacts can be mitigated in Segment B.

All Segment B alternatives would likely involve the use of a temporary construction easement in the Mercer Slough Nature Park. Except for Alternative B7, these would be limited to the western park border, which may require trail and other access detours during construction. Except for *Preferred Alternative B2M,* construction of the at-grade alternatives (B1, B2A, and B3) would require widening Bellevue Way SE. Constructing elevated profiles may result in closing or narrowing travel lanes and the use of temporary easements. For Alternative B7, a raised platform could be built across the Mercer Slough to reach the construction site within the marshy areas.

Elevated portions of the guideway may require pile driving, and, therefore, would result in noise impacts during daytime construction hours. This may have temporary adverse effects on wildlife in the vicinity.

Segment C

A summary of Segment C impacts is provided in Table 6-4. Elevated alternatives east of the Downtown Bellevue business and commercial core (Alternatives C7E and C14E) would result in the fewest transportation impacts during operation but do not provide as direct access to the downtown core as other Segment C alternatives. *Preferred 110th NE At-Grade Alternative (C11A),* Couplet Alternative (C4A), and 108th NE At-Grade Alternative (C9A) would permanently remove up to two travel lanes on either 108th or 110th Avenues NE (although travel lanes on both streets would be removed with Alternative C4A).

While these at-grade alternatives would affect some north-south vehicle operations, overall downtown intersection operations are expected to experience minimal change compared to the 2020 and 2030 No Build Alternative. Operational traffic management strategies would be proposed at impacted intersections in lieu of roadway capacity improvements. Noise and vibration impacts of tunnels can be substantially mitigated, except for few instances of residual vibration impacts. All Segment C alternatives would result in noise impacts from light rail, whereas only Alternative C1T would result in noise impacts from increased traffic due to shift in Bellevue Way SE, all of which can be mitigated.

Many of the Segment C impacts would be caused during construction by lane closures, dislocating buses from the Bellevue Transit Center, utility relocation, noise, vibration, dust, truck traffic, and associated impacts on businesses. Tunnel construction would require longer construction periods than elevated and at-grade portions. Cut-and-cover construction might have greater impacts on nearby businesses resulting from reduced access and extended construction disturbances.

Preferred108th NE Tunnel Alternative (C9T) and the Bellevue Way (C1T) and 108th NE Tunnel (C2T) Alternatives would interface with hazardous material sites and have a high degree of utilities relocation. Alternative C1T would have the highest number of potential residential relocations of alternatives in Segment C and is the only corridor that has a relatively high risk of soil settlement that may be avoided through engineering and construction methods. Because of primarily bored tunnel construction, the 108th NE Tunnel Alternative (C3T) would result in less conflict with utilities and less disruption of traffic and businesses than *Preferred Alternative C9T* and Alternatives C1T and C2T.

These tunnel alternatives would involve large portions of cut-and-cover construction in high rise areas to avoid conflicts with the underground structural supports of the adjacent building foundations and underground parking structures. Like the cut-and-cover alternatives, *Preferred Alternative C11A* and Alternatives C4A and C9A would require relocation of utilities directly under and parallel to the route. Elevated alternatives—112th NE (C7E), 110th NE (C8E), and 114th NE (C14E)—would generally result in the fewest residential displacements and utilities impacts.

Alternatives C1T, and C14E would not impact any parks, whereas Alternatives C3T, C4A, and C8E would occupy a large portion of McCormick Park during construction. This park would be replaced to preconstruction size or larger, and the light rail would be located between the park and NE 12th Street, which

Acres converted to transportation use	20.1 to 24.1	23.1 to 23.8	19.7 to 25.6	17.7 to 20.4
Permanent wetland impact in acres	0 to 0.1	0.1	Less than 0.1	0
High-value loss in acres	0 to 0.1	0.1 to 0.2	0	0
Stream crossings	0	0	1	0
Change in impervious surface in acres	+2.5 to +3.7	–0.4 to –3.7	–1.0 to –1.7	+1.8 to +2.3
Construction risk	Low	Low	Low	Low

[a] Without HOV lanes in the outer roadways between Mercer Island and Rainier Avenue South (Stages 1 and 2 only of the I-90 Two-Way Transit and HOV Operations Project).
[b] With HOV lanes in the outer roadways (HOV lanes Stages 1 – 3 completed of the I-90 Two-Way Transit and HOV Operations Project)
[c] The C9T - East Main Station Design Option when connecting with *Preferred Alternative B2M* would not change any of the ranges presented for *Preferred Alternative C9T*.

would reduce the visual quality of the park for adjacent residents and park users. Also, both P*referred Alternatives C11A* and *C9T* connecting from *Preferred Alternative B2M* would permanently affect Surrey Downs Park, including changes in access. However, after construction, remaining land outside the light rail track along 112th Avenue NE would be available as landscaped extensions of Surrey Downs Park. Also, Alternatives C3T, C2T, C4A, C7E, and C9A when connecting from B2A would affect some portion of Surrey Downs Park. Alternatives C2T and C3T would not result in operational impacts on Surrey Downs Park. Alternatives C4A, C7E, and C8E would result in acquiring 0.5 acre or less of the street side landscaping and no recreational activity areas. *Preferred Alternative C9T,* Alternative C9A, and Alternative C4A would affect the NE 2nd Pocket Parks. All park impacts except long-term visual impacts on McCormick Park could be mitigated. The park impacts would occur primarily during construction.

Most of the staging areas would be available for redevelopment consistent with applicable zoning following construction. Construction of tunnels may require some periods of night work and have a longer construction duration and number of truck trips than surface alternatives. The construction of Alternatives C4A, C7E, and C8E would involve the fewer number of truck trips over tunnel alternatives and *Preferred Alternatives C11A* and *C9T.* The staging areas for *Preferred Alternative C11A* and Alternatives C2T, C3T, and C4A would be adjacent to contributing properties to the potential Surrey Downs historic district, whereas *Preferred Alternative C9T* and Alternative C9A staging areas are further away, thus buffering the potential Surrey Downs historic district from possible impacts during construction.

With the exception of Alternative C1T, there would be a range of impacts in Segment C alternatives from the variation in connections from Segment B. Different connectors would result in different areas needed as construction staging areas. Because of the high-density urban environment in Downtown Bellevue, staging areas that would be needed during construction have been identified. Variations in property acquisition, numbers of displaced employees, and temporary impacts on Sturtevant Creek would be due to the connections from Segment B. Connections from the 112th Avenue SE alternatives (P*referred Alternative B2M* and Alternatives B2E and B2A) would result in higher residential impacts except when Alternative B2A connects with tunnel alternatives (Alternatives C2T and C3T) or Alternatives C7 or C9A, which would result in no residential displacements. The connector between Alternative B2A and the Alternatives C2T or C3T tunnels would occupy the north part of Surrey Downs Park, including the King County District Courthouse, which is planned to be relocated in the development of Surrey Downs Park, whereas connections from Alternative B2A for other Segment C Alternatives would only affect the streetside landscaping. Construction impacts on Surrey Downs Park would also result from the *Preferred Alternative B2M* connection to *Preferred Alternatives C11A* or *C9T*, thus affecting landscaping and portions of the District Courthouse parking, but *Preferred Alternative C9T* would also affect a portion of the Courthouse building. After construction, the entire park would be restored and usable. The *Preferred Alternatives C11A* and *C9T* would acquire 46 residential units west of 112th Avenue SE if connecting to *Preferred Alternative B2M* (no difference with the East Main Station Design Option), and no residences if connecting to Alternatives B3 or B7. Connections from Alternatives B3 and B7 would result in ecosystem impacts and more employee displacement than other connectors.

Segment D

The Segment D alternatives would not vary greatly in their impacts, as shown in Table 6-4. The primary difference would be that the SR 520 Alternative (D5) could have up to two fewer stations in the Bel-Red subarea, which may influence redevelopment in this area and would provide fewer points of access to East Link. Because of this difference, Alternative D5 would require the fewest property displacements, lowest employee displacements, and least utility relocations. In contrast, Alternative D5 would result in the highest loss of high-value habitat and the highest number of business displacements. *Preferred NE 16th At-Grade Alternative (D2A)* would have lowest impacts on businesses, highest potential wetlands impacts (less than 1 acre), and second-highest impacts on high value habitat.

All alternatives except Alternative D5 would have station locations that would support transit-oriented development for both the Bel-Red subarea in Bellevue and the Overlake Village subarea in Redmond consistent with local land use plans. The NE 20th Alternative (D3) would involve building a retained cut in the median of NE 20th Street. This alternative could result in the highest employee displacement and would likely have the highest impact on access to adjacent businesses. Alternatives D3 and D5 could result in minor adverse impacts on fish-bearing streams, but this impact can be mitigated to a net benefit. Alternative D5 would result in the greatest noise impact during operation, which can be mitigated. All intersections affected by the Segment D alternatives would be mitigated.

Construction impacts from the Segment D alternatives would involve traffic detour routes, truck trips, and possible pile-driving noise for elevated and retained-cut portions of the alternatives. Alternative D3 would result in a high number of truck trips and would potentially affect the largest number of businesses due to retained-cut construction along a major commercial corridor, NE 20th Avenue. *Preferred Alternative D2A* and Alternative D5 would have slightly fewer construction impacts than Alternatives D3 and D2E. The nonpreferred D2A design options would have similar to greater construction impacts than Alternatives D3, D5, and D2E.

The preferred storage tracks in the former BNSF Railway corridor north of the NE 12th Street Crossing in Segment D would have minimal environmental impacts—only partial property impacts and minor wetland impacts.

Segment E

The main environmental impact differences among alternatives in Segment E would involve park, historic resources, and visual impacts, as shown in Table 6-4. *Preferred Alternative Marymoor Alternative (E2)* and Redmond Way Alternative (E1) would have similar and lower environmental impacts than the Leary Way Alternative (E4) and Alternative E2 - Redmond Transit Center Station Design Option. Alternative E1 would have higher noise impacts, which all would be mitigated. *Preferred Alternative E2* and the Alternative E2 - Redmond Transit Center Design Option would have the greatest park impacts because of their route along Marymoor Park. The E2 - Redmond Transit Center Design Option would require the most residential displacements, which would not occur under P*referred Alternative E2* that terminates at the Redmond Downtown Station. Alternative E4 would result in minor impacts on park property, but it would change the visual quality along the Leary Way gateway to the Redmond City Center and require relocation of the Justice William White House, an eligible resource for the National Register of Historic Places. Transportation impacts would be generally similar among the Segment E alternatives, although *Preferred Alternative E2* and the E2 - Redmond Transit Center Design Option would have worse operations at a few additional intersections, although these would be mitigated.

Construction for the Segment E alternatives would require the temporary detour of the Sammamish River Trail, Bear Creek Trail, and the East Lake Sammamish Trail and possible pile driving along SR 520 and Lake Sammamish Parkway. E2 - Redmond Transit Center Design Option would also require the full closure of 161st Avenue NE during construction.

Maintenance Facilities

A summary of maintenance facility impacts is provided in Table 6-4. All the proposed maintenance facility alternatives are located in predominantly commercial/industrial areas that are compatible land use. The 116th Maintenance Facility (MF1) and the SR 520 Maintenance Facility (MF3) would displace substantially more businesses (up to 82 and 60, respectively) than the other potential maintenance facility locations. MF1 and MF3 would also have the most potential employee displacements—up to 890 employees each. The SE Redmond Maintenance Facility (MF5) would have the fewest employee displacements— 410 or fewer people. The fewest business displacements would occur under the BNSF Maintenance Facility (MF2), which would only displace five to six businesses, depending on the alternative connection. MF1, MF2, and MF3 would require wetlands or wetland buffers to be filled. In addition, MF3 would result in an increase of 42 linear feet of open stream channel by replacing two culverts with shorter ones on Goff Creek or culverts can be avoided by realigning the stream.

6.1.3 Land Use Goal: Support Regional and Local Land Use Goals and Objectives

6.1.3.1 Projectwide Support of Land Use Goals and Objectives

The East Link Project would support regional and local land use goals and objectives. East Link is a critical element in the region’s long-term plan to manage growth. It would support the continued planned development of urban centers along the East Link corridor, including Downtown Bellevue and Overlake. As the Metropolitan Planning Organization (MPO) and Regional Transportation Planning Organization (RTPO) for the region, The Puget Sound Regional Council (PSRC) has adopted growth management plans to direct much of the expected growth in population and employment into the urban centers in the Puget Sound region, in large part to help reduce low-density development from expanding the urban edge and the related impacts of growth on the environment. This growth management plan needs transportation options that support such targeted growth.

East Link is consistent with the PSRC growth management strategy, *VISION 2040* (PSRC, 2008), which promotes the development of a coordinated transportation system that is integrated with and builds upon local, countywide, regional, and state planning efforts. *VISION 2040's* focus is to contain growth, concentrate new employment into urban centers, and link urban centers with a high-quality multimodal transportation system.

The *VISION 2040* growth strategy is also designed to foster a greater mix of land uses and a more complete and efficient network of streets and other public rights-of-way, and to support an urban environment that is more amenable to walking, bicycling, and using transit. As the Regional Transit Authority (under Chapter 81.104 and 81.112 the Revised Code of Washington [RCW]), Sound Transit is responsible for regional HCT system planning in the context of *Transportation 2040*.

Sound Transit's Regional Transit Long-Range Plan, adopted in 2005, represents Sound Transit's goals, policies, and strategies for the long-term development of an HCT system within the central Puget Sound region. This long-range plan is the basis for Sound Transit 2: a Mass Transit Guide, the Regional Transit System Plan for Central Puget Sound (ST2). ST2 is also known as the Mass Transit Expansion proposal. The East Link Rail Transit Project is included in ST2, which was approved by the voters in November 2008.

The East Link Project would support jurisdictional efforts to implement regional policies related to HCT to fulfill plans and policies in those jurisdictions, especially those related to transit-oriented development. The success of such development depends to a considerable degree on supportive policies designed to make areas around transit stations more attractive for development than other areas.

East Link would promote this development by connecting four of the urban growth centers identified in *VISION 2040*, including Seattle, Bellevue, Overlake, and Redmond. East Link would provide direct transit access between these centers and other regional and local destinations. East Link would allow jurisdictions to better implement transit and pedestrian-oriented land use patterns where current zoning allows. Many of the local jurisdictions have also identified new opportunities for mixed-use development in addition to those that are classified as urban centers by the *VISION 2040* plan, such as Mercer Island's City Town Center, the City of Bellevue's Bel-Red area, and Redmond's Overlake Village.

Transportation 2040 is the transportation element of *VISION 2040* and the long-range plan for transportation in the central Puget Sound region through the year 2040 (PSRC, 2010). *Transportation 2040* aims to improve mobility, protect and enhance the environment, and identify sustainable funding. It supports a balanced, multimodal transportation system that provides options for users; the plan identifies both state and local roadway projects, transit and ferry projects, as well as bicycle and pedestrian projects. The East Link Project is one of the key components in *Transportation 2040* to develop a regional HCT system linking urban centers.

Issaquah, Kirkland, Renton, Bothell, and Woodinville are planned to be served by future HCT phases according to the Sound Transit Long-Range Plan. All alternatives of the East Link Project allow for future expansion to the east.

6.1.3.2 Segment-Specific Support of Land Use Goals and Objectives

Segment A

Segment A of the East Link Project would specifically meet the City of Seattle's goals to promote urban villages, link urban centers, and facilitate access to employment centers for Central Area residents with expanded access to the Eastside via the International District/Chinatown Station and new access via the Rainier Station. The City of Mercer Island also has goals to promote mixed-use development at regional transit facilities and to provide adequate transit opportunities, especially serving its city center of mixed-use development adjacent to the planned Mercer Island Station. The Rainier Station and Mercer Island Station would promote localized, mixed-use urban village development.

Segment B

In order to connect Seattle and Bellevue urban centers, light rail must travel through South Bellevue to and from the I-90 Lake Washington crossing. This area is primarily residential and low-density, and it has not been designated for higher-density development by the City of Bellevue. All the Segment B alternatives would serve either an expanded South Bellevue Park-and-Ride Lot or a new park-and-ride lot near 118th Avenue SE and SE 8th Street. *Preferred Alternative B2M to C9T* and Alternatives B2A and B2E would include another station at 112th Avenue SE and SE 8th Street, unless the East Main Station Design Option was selected for *C9T*. East Link would increase park-and-ride capacity and travel options for residents in South Bellevue neighborhoods and new transit access for employees in business parks located east of 112th Avenue SE, consistent with City of Bellevue transportation goals.

Segment C

Segment C is located within Downtown Bellevue, which has been designated an urban center by PSRC and is the focus of Bellevue's efforts to increase residential and employment density. The *City of Bellevue Downtown Implementation Plan* also identifies HCT as an important element of the downtown transportation plan (City of Bellevue, 2003). The City of Bellevue has adopted a goal of a non-single-occupant-vehicle commute of 40 percent as part of its Growth Efficiency Transportation Center Policy. Segment C alternatives feature up to three stations serving Downtown Bellevue. The Segment C alternatives would all access the Bellevue Transit Center and Overlake/Group Health Hospital Medical Center. For Alternatives C7E and C14E, the Bellevue Transit Center Station would be located on an elevated platform approximately 800 and 1,300 feet away, respectively, from the transit center. These alternatives include a level pedestrian bridge to connect riders to the transit center.

To serve the southern portion of Downtown Bellevue, *Preferred Alternative C11A* would provide a station at 108th Avenue NE and Main Street if connecting from *Preferred Alternative B2M* or the station at East Main if connecting from via Alternatives B3 or B7. Alternative C1T would provide an additional station at Main Street in Old Town Bellevue, an established residential and retail district that has ongoing projects to increase density. *Preferred Alternative C9T*, and those alternatives (except *C11A*) that connect to Segment B via Alternatives B3 or B7 would have an additional station at 112th Avenue SE and Main Street. And if connecting from *B2M, C9T* also includes the East Main Station Design Option, where ridership would be similar to the B3 and B7 East Main Station ridership.

Segment D

Segment D is located within the Bel-Red/Overlake sub-areas, which are planned for substantial redevelopment in coming years. The *Bel-Red Subarea Plan* (City of Bellevue, 2007) promotes transitioning this corridor from primarily light industrial land uses to denser mixed-use land uses, with retail, office, residential, and open space developed around transportation nodes, which are planned at the proposed 120th and 130th stations. One of the stations may be deferred, but both are planned to be constructed. An additional 4.5 million square feet of commercial and office space and an additional 5,000 residential units are forecast for the area by 2020. *Preferred Alternative D2A* and Alternatives D2E and D3 would best facilitate this plan through the placement of stations at approximately 120th Avenue NE and/or 130th Avenue NE. If only one of the stations were built for *Preferred Alternative D2A*, Alternative D2E, or Alternative D3, the station development might influence the timing and specific location of planned transit-oriented development within the corridor. However, these alternatives would still be more consistent with land use goals for transit-oriented development and planned density when compared to Alternative D5, which would bypass these first two station sites and thereby limit the ability of the East Link Project to facilitate transit-oriented development and increased density in this corridor.

The far eastern portion of Segment D is referred to as Overlake Village neighborhood, which is a subarea in the Overlake neighborhood and is also identified by PSRC as a growth center. Redmond's Overlake neighborhood has been designated as an urban center. Redmond's *Overlake Neighborhood Plan* supports transit-oriented development in the area around 152nd Street and NE 24th streets through its land use and transportation goals and policies. This is the Overlake Village neighborhood, which is planned to accommodate an additional 5,800 residential units by 2030. The entire Overlake neighborhood is planned to accommodate an additional 4.5 million square feet of commercial development by 2030. The Overlake Village stations with *Preferred Alternative D2A* and Alternatives D2E and D3 would best meet Redmond transit-oriented development planning objectives.

Preferred Alternative D2A and Alternative D5 would provide a station in the Overlake Village area adjacent to SR 520, adjacent to the planned high-density, mixed-use center. All alternatives would serve the Overlake Transit Center.

Segment E

The Segment E alternatives would serve the Downtown Redmond urban center and SE Redmond, two areas the City of Redmond seeks to connect using rapid transit to support continued mixed-use redevelopment goals. The land uses in Downtown Redmond are generally mixed with multifamily residential, commercial retail shopping, and mid-rise office complexes. Redevelopment is occurring within the northwest portion of Downtown Redmond around the Redmond City Hall and the Redmond Transit Center. Southeast of Downtown Redmond, the land uses change considerably. South of the SR 202 and SR 520 interchange, land uses include light industrial/manufacturing.

All Segment E alternatives would equally serve Downtown Redmond, thus equally meeting the plan and policy goals to support redevelopment; however, if extended beyond Redmond Town Center, E2 – Redmond Transit Center Design Option would provide closer access to the Redmond Transit Center, which is across NE 83rd Street from the site of a relocated park-and-ride lot in conjunction with transit-oriented development. *Preferred Alternative E2* includes the Downtown Redmond Station, which is equidistant to the transit center, Redmond City Hall, and Redmond City Center shopping area.

Maintenance Facilities

As stated above under Segments D and E, the existing land uses around all the proposed maintenance facilities are generally light industrial or commercial, which are compatible with maintenance facility operations. The Bel-Red area is no longer zoned for industrial uses; however, the subarea plan identifies the area as a potential location of a maintenance facility and that Bellevue would work with Sound Transit on siting the maintenance facility if one was required for East Link. The least compatible maintenance facility with adjacent uses is MF1, which borders office and medical facilities to the south and west but otherwise is surrounded by light industrial uses and the former BNSF Railway corridor. MF1 would be cut into the hillside and therefore would be nearly 30 feet lower than the hospital site to the south and other sites to the west. Children's Hospital Bellevue Clinic and Surgery Center is newly built on the top of this ridge.

6.1.4 Implementation Goal: Minimize Risks

Sound Transit has a goal to minimize risks in the East Link corridor by enhancing stakeholder and community support and through recognizing and managing construction risks.

6.1.4.1 Enhance Stakeholder and Community Support

The objective of the community support goal is to involve the community in the project development and design process. The development of the East Link project has continued Sound Transit's commitment to involving the community at every step of the project. As described in Appendix B, Public Involvement and Agency Correspondence, the outreach effort in the East Link area began with the original project planning, design, environmental scoping, and development. In September 2006, the environmental scoping began for the East Link Draft EIS. Outreach activities have included hosting public open houses and workshops, offering information at local public meetings, making door-to-door visits, and ongoing agency coordination. In addition, Sound Transit's outreach staff has attended community events, posted regular project updates on the Sound Transit website, and mailed fact sheets and project announcements throughout the project corridor.

The Sound Transit Board identified the alternatives to be evaluated in the Draft EIS at its December 14, 2006, meeting. The Draft EIS alternatives were the result of several workshops with community members and key stakeholders. The Draft EIS public review period was a total of 75 days, which resulted in four public hearings, and more than 700 submitted comment letters, which have all been reviewed and responded to in this Final EIS (see Chapter 7 and Appendix J). In response to comments received during the Draft EIS, Sound Transit engaged the City of Bellevue and Redmond in additional exploration of alternatives development.

In December 2009 through January 2010, Sound Transit and City of Bellevue collaborated in producing the *Downtown Bellevue Concept Design Report* that evaluated six alternatives in detail. Following the downtown study, the *Hospital Station and the 112th Avenue Light Rail Options* were explored with extensive public involvement from the community and interested stakeholders. This process looked at four locations for the Hospital Station relative to NE 8th Street and at optional access points to the hospital district. Along 112th Avenue SE, Sound Transit held a series of four public workshops that examined at-grade and retained-cut profiles traveling in the center and on the east and west sides of 112th Avenue SE. Based on input from the community, the Sound Transit Board identified the *Preferred Alternative* for a west side-running alignment along 112th Avenue SE north of SE 6th Street. All new alternatives and modifications to existing alternatives were studied and released for public review in the Supplemental Draft EIS in November 2010. The public comment period closed 45 days later, on January 10, 2011. All comments received during this period are also addressed in this Final EIS, summarized in Chapter 7 and presented as individual responses in Appendix I.

Throughout the process, Sound Transit has made it a priority to engage diverse populations early in the planning and development process by providing outreach information packets and making them available in multiple formats. Before scoping, Sound Transit identified minority and low-income populations based on U.S. Census data. Sound Transit literature has included a language block (i.e., text box on the literature) translated into Russian, Chinese, Spanish, Vietnamese, Farsi, and Tagalog regarding contacting and speaking with Sound Transit staff in those languages about the East Link Project. Also, Sound Transit identified and conducted targeted outreach to organizations that serve minority, non-English-speaking, and low-income populations within the East Link Project vicinity. These organizations were sent notification postcard and received follow-up phone calls to find out whether the organizations needed additional information about the East Link Project, and they were reminded how they could submit public comments. Organizations were also asked if they would like project staff to sit down with members of their organization to review the environmental information.

The East Link Project has received considerable controversy from the communities in proximity to, and stakeholders with interests in, Segments B and C. None of the alternative in these segments have achieved consensus. East Link Project development has continued Sound Transit's commitment to involving the community at every step of the project.

6.1.4.2 Reduce Construction Risks

Sound Transit has evaluated possible construction risk issues for each alternative. At this early design stage, the construction risk analysis found that risks are generally highest with tunnel construction, retained cuts, or at-grade construction in dense environments. However, Sound Transit, with research from WSDOT experience on I-90, also found that crossing Mercer Slough Nature Park raises risk concerns as well. Table 6-5 summarizes the results of the analysis by alternative and identifies which alternatives are higher or lower than other alternative risks and a discussion of the higher risk construction methods are described below.

TABLE 6-5
Level of Construction Risk by Alternative[a]

Segment	Alternative	Risk
A, Interstate 90	*Preferred Interstate 90 Alternative (A1)*	Lower
B, South Bellevue	*Preferred 112th SE Modified Alternative (B2M)*	Moderate
	Bellevue Way Alternative (B1)	Lower
	112th SE At-Grade Alternative (B2A)	Lower
	112th SE Elevated Alternative (B2E)	Lower
	112th SE Bypass Alternative (B3)	Lower
	BNSF Alternative (B7)	Moderate
C, Downtown Bellevue	*Preferred 108th NE At-Grade Alternative (C11A)*	Moderate
	Preferred 110th NE Tunnel Alternative (C9T)	Higher
	Bellevue Way Tunnel Alternative (C1T)	Higher
	106th NE Tunnel Alternative (C2T)	Higher
	108th NE Tunnel Alternative (C3T)	Higher
	At-Grade Couplet Alternative (C4A)	Moderate
	112th NE Elevated Alternative (C7E)	Lower
	110th NE Elevated Alternative (C8E)	Lower
	110th NE At-Grade Alternative (C9A)	Moderate
	114th NE Elevated Alternative (C14E)	Lower
D, Bel-Red/Overlake	*Preferred NE 16th At-Grade Alternative (D2A)*	Lower
	NE 16th Elevated Alternative (D2E)	Lower
	NE 20th Alternative (D3)	Moderate
	SR 520 Alternative (D5)	Lower
E, Downtown Redmond	*Preferred Marymoor Alternative (E2)*	Lower
	Redmond Way (E1)	Lower
	Leary Way (E4)	Lower
Maintenance Facilities	116th Maintenance Facility (MF1)	Lower
	BNSF Maintenance Facility (MF2)	Lower
	SR 520 Maintenance Facility (MF3)	Lower
	SE Redmond Maintenance Facility (MF5)	Lower

[a] The risk was assessed for the whole alternative, and therefore design options are assumed to have the same associated risk.

Tunnel Construction

Sound Transit concluded that the greatest construction risk would be associated with the Segment C tunnel alternatives (*Preferred Alternative C9T* as well as Alternatives C1T, C2T, and C3T). *Preferred Alternative C9T* and Alternatives C1T and C2T are primarily cut-and-cover tunnel excavation.

Most of Alternative C3T is bored and portions of C2T are proposed to be bored, but cut-and-cover is necessary to avoid impacting soil nails, which are large underground braces holding adjacent property foundations. Generally, more tunnel construction results in increased risk reflected in costs and safety issues. Tunnel construction would generate a large amount of excavated material that would need to be moved to a staging area and ultimately to a disposal site.

Limitations on haul truck movements and location of actual disposal sites would have cost impacts on the construction. However, there are some differences in risk, depending on whether the tunnel is created by boring, using a cut-and-cover method, or by sequential excavation mining construction methods.

Bored Tunnels (portions of Alternative C2T and most of Alternative C3T) would pass through glacial till in Downtown Bellevue and may encounter boulders and building tie-backs. Bored tunnels have a high degree of risk as a result of the uncertainty associated with below-grade soils.

Cut-and-Cover Tunnels (*Preferred Alternative C9T* and Alternatives C1T and C2T) would require larger amounts of soil excavation and replacement than the bored tunnels. Because construction access is from the surface, cut-and-cover may involve permanent relocation of existing utilities in otherwise dense utility corridors. Sometimes utilities can be held in place, but maneuvering around utilities is a risk. Also, cut-and-cover tunnel construction results in considerable traffic management issues caused by lane closures, detours, and signal modification. Therefore *Preferred Alternative C9T,* Alternative C1T, and Alternative C2T would have a higher risk than Alternative C3T, which is best suited for the bored tunnel method. However, among these cut-and-cover tunnels, *Preferred Alternative C9T* is the shortest, thus limiting the length of risk areas under construction. In addition, all tunnel alternatives would include cut-and-cover station construction; Alternative C1T would have two cut-and-cover stations, whereas Alternatives C2T and C3T have only one, the Bellevue Transit Center Station.

Sequential Excavation Mining is the most risky form of tunnel construction. The process is slower and more expensive and may involve higher safety risks over other tunnel construction methods. This method is only employed when neither bored nor cut-and-cover methods are practical. This method would only occur under the Bellevue Arts Museum for Alternative C1T.

Retained-Cut Construction

Like cut-and-cover, a retained-cut construction requires large amounts of soil excavation and utility relocation. Retained-cut construction would occur in portions of Alternative C1T and *Preferred Alternatives B2M* and *C11A* (albeit minor distance and depth), D2A - 120th Station Design Option and Overlake Transit Center Station, portions of Alternatives D3 and D5, and in all Segment E alternatives adjacent to SR 520. The risk occurs most strongly in urban corridors (Alternatives C1T and D3), where there is limited area to relocate utilities and high conflicts with traffic during construction.

At-Grade in Dense Urban Environment

Constructing at-grade alternatives in dense, urban environments can result in moderate risks. A constrained right-of-way makes construction more difficult and more costly. For long-term reliability in service, all utilities parallel to and located underneath an at-grade route would need to be relocated and crossings would need to be encased such that utility access can be obtained without affecting light rail operations. This would increase the risk on the construction of *Preferred Alternative C11A* and Alternatives C4A and C9A and would present a risk due to the number of potential utility conflicts located along 108th Avenue NE and 110th Avenue NE. The design of these alternatives would account for utility relocation, and accurate utility surveying and pothole data would be paramount in reducing risk.

Mercer Slough Crossing Construction

WSDOT has found soft clays and peat soils at the center of the Mercer Slough Nature Park that, in addition to being soft and settlement prone, move horizontally as the level of Lake Washington changes, resulting in large soil loading to the existing I-90 structures that cross the slough. The slough crossing for Alternative B7 would have to be designed and constructed to accommodate these soil conditions resulting in higher risk than for other elevated profiles and an overall moderate risk for Alternative B7.

6.1.5 Financial Goal: Achieve Financial Feasibility

Sound Transit is committed to implementing a light rail system that not only meets regional transportation needs but also meets the following financial goals:

- Build a system within project budget.
- Build a system that can be operated and maintained within available revenue.
- Build a system that is cost-effective.

6.1.5.1 Building the Project within Budget

The ST2 approved by voters in November 2008 would fund the construction portion of the East Link Project from Seattle to the Overlake Transit Center Station. ST2 provides funding for an at-grade or elevated alternative through Downtown Bellevue. If the Sound Transit Board selects a tunnel alternative in this segment, additional funding sources would be required. Environmental review and preliminary engineering are funded by ST2 for the segment from Overlake Transit Center Station to Downtown Redmond. However, the overall project cost would vary depending on which alternatives are selected and which stations and other elements are included in the project.

The cost of the East Link Project from Seattle to the Overlake Transit Center is estimated to range between $2.0 and $3.7 billion. If the project were only built to the Hospital Station (east end of Segment C), the high-cost project would be just under $3 billion, whereas the low-cost project would be just under $2 billion. Many factors weigh into the difference in cost beyond just the length of the project, such as number of stations, profile of the route, and varying costs for property acquisition. The high project cost estimate includes a tunnel alternative in Segment C, Downtown Bellevue, and the low-cost includes an elevated alternative in Downtown Bellevue. The overall project cost range to complete the East Link Project to its terminus in Downtown Redmond is currently estimated to fall between $2.4 and $4.5 billion. Table 6-6 summarizes the estimated cost for each alternative by segment. The range in costs is due to design options or variations in the connectors between segments as well as cost estimates with and without project reserve.

There is only a slightly higher cost consideration for *Preferred Alternative A1* for the potential accommodation of joint bus and light rail use of the D2 Roadway. In Segment B, however, the range of costs varies by the length of elevated or retained-cut profile versus at-grade and the amount of property acquisition required for each alternative. The cost of Segment B alternatives range from approximately $370 million to $590 million with and without project reserve. *Preferred Alternative B2M* includes the cost of preserving both HOV access ramps from I-90 to Bellevue Way SE as required by WSDOT. While Alternative B1 remains the lowest cost overall, Alternative B2A is the second lowest with a range of $430 to $505 million and *Preferred Alternative B2M* is third least costly.

Preferred Alternative B2M would result in lower costs in Segment C with *Preferred Alternatives C11A* or *C9T* than with Alternatives B3 or B7 because the route continuing north along 112th Avenue SE into downtown has less elevated structure than with Alternatives B3 and B7. While the East Main Station Design Option would add cost to *C9T*, it would be offset from the removal of a station on B2M at SE 8th Street. In contrast, Alternative B1 combined with Alternative C1T results in the highest cost combination. The tunnel alternatives in Segment C are the most costly, and the at-grade or elevated profiles result in lower, but comparable, costs.

Preferred Alternative C11A and Alternative C4A are comparable with the elevated alternatives because of higher utility relocations and more property acquisition. Alternative D5 is the least costly among Segment D alternatives because it has fewer stations and fewer large-business displacements. Of the remaining Segment D alternatives, *Preferred Alternative D2A* is the least costly, but the D2A - NE 24th Design Option makes this alternative similar in cost to Alternatives D2E and D3.

TABLE 6-6
Estimated Cost by Alternative

Alternative	Estimated Cost (millions, 2007$)
Segment A, Interstate 90	
A1, I-90 Alternative	$635 to $750
Segment B, South Bellevue	
Preferred 112th SE Modified Alternative (*B2M)* to *C11A*	$470 to $540
Preferred 112th SE Modified Alternative (B2M) to *C9T*	$480 to $550
Bellevue Way Alternative (B1)	$355 to $405
112th SE At-Grade Alternative (B2A)	$390 to $450
112th SE Elevated Alternative (B2E)	$445 to $510
112th SE Bypass Alternative (B3)	$430 to $490
B3 – 114th Extension Design Option	$500 to $575
BNSF Alternative (B7)	$515 to $590
Segment C, Downtown Bellevue	
Preferred 108th NE At-Grade Alternative (C11A)	$555 to $690
Preferred 110th NE Tunnel Alternative (C9T)[a]	$790 to $1,025
Bellevue Way Tunnel Alternative (C1T)	$1,405 to $1,615
106th NE Tunnel Alternative (C2T)	$1,115 to $1,365
108th NE Tunnel Alternative (C3T)	$975 to $1,260
At-Grade Couplet Alternative (C4A)	$535 to $705
112th NE Elevated Alternative (C7E)	$435 to $600
110th NE Elevated Alternative (C8E)	$615 to $705
110th NE At-Grade Alternative (C9A)	$465 to $645
114th NE Elevated Alternative (C14E)	$495 to $575
Segment D, Bel-Red/Overlake	
Preferred NE 16th At-Grade Alternative (D2A)[b]	$670 to $765
D2A – NE 24th Design Option	$710 to $820
NE 16th Elevated Alternative (D2E)	$695 to $840
NE 20th Alternative (D3)	$735 to $875
SR 520 Alternative (D5)	$470 to $580
Segment E, Downtown Redmond	
Preferred Marymoor Alternative (E2)	$555 to $635
E2 – Redmond Transit Center Design Option	$690 to $795
Redmond Way (E1)	$595 to $685
Leary Way (E4)	$505 to $580
Maintenance Facilities	
116th Maintenance Facility (MF1)	$430 to $465
BNSF Maintenance Facility (MF2)	$310 to $315
SR 520 Maintenance Facility (MF3)	$365 to $385
SE Redmond Maintenance Facility (MF5)	$240 to $280

Otherwise, as in Segment B, the Segment D alternative costs vary by the profile and the right-of-way costs, with Alternative D3 being the highest cost because it has both elevated and retained-cut profiles. Finally, in Segment E, the *Preferred Alternative E2* is the second least expensive when not including the E2 - Redmond Transit Center Design Option. The shortest alternative, Alternative E4, is the least costly.

6.1.5.2 Build a System That Can Be Operated and Maintained Within Available Revenue

Annual operating costs for the East Link Project would vary by profile type and number of stations. The ST2 funds operation of the portion of the East Link Project from Seattle to Overlake Transit Center Station. The major determinants of operating costs for the project are service levels, running time, and trackway profile. The more frequent the service and the longer the line, the more vehicles it takes to maintain equivalent headways. Shorter alternatives with fewer stations have lower operating costs. In terms of line and station maintenance, at-grade is the lowest cost, elevated the next highest, and tunnel is the highest cost. The primary difference in cost lies in whether the project includes a tunnel through Downtown Bellevue. Operations for tunnels are more costly to maintain because of additional infrastructure components, such as stairwells, escalators, elevators, vent shafts, and station walls. In addition, tunnel stations require unique security and lighting considerations.

6.1.5.3 Cost-Effectiveness of Project and Alternatives

Cost-effectiveness was measured consistent with FTA methods as the project's annualized cost divided by the projected number of riders that the project would attract each year, for a cost-per-rider estimate. Annualized costs are the project's construction costs averaged over the years of operation. Costs are presented and discussed in detail in Chapter 2, Alternatives Considered, of this Final EIS. These cost-effectiveness estimates offer decision-makers a point of comparison among the alternatives.

Within the estimated cost range for the East Link Project, from the low-cost ($2,435 million without project reserve and $2,940 million with project reserve) that combines *Preferred Alternative A1*, Alternative B2A, Alternative C7E, Alternative D5, and Alternative E4, to high-cost ($3,835 million without project reserve and $4,435 million with project reserve) for the combination of *Preferred Alternative A1*, Alternative B1, Alternative C1T, Alternative D3, and *Preferred Alternative E2* with the E2 - Redmond Transit Center Design Option, there is a range in cost-effectiveness, depending on which segment alternatives are combined (Exhibit 6-1). The low-cost project would be the most cost-effective. The high-cost project would be the least cost-effective but would offer roughly 7 percent greater ridership than the low-cost project. The *Preferred Alternatives* (at-grade or tunnel) in Downtown Bellevue are $7.50 and $7.95 annualized cost per rider, respectively. While the project with the tunnel is more costly, the time savings results in higher ridership and therefore similar overall cost-effectiveness.

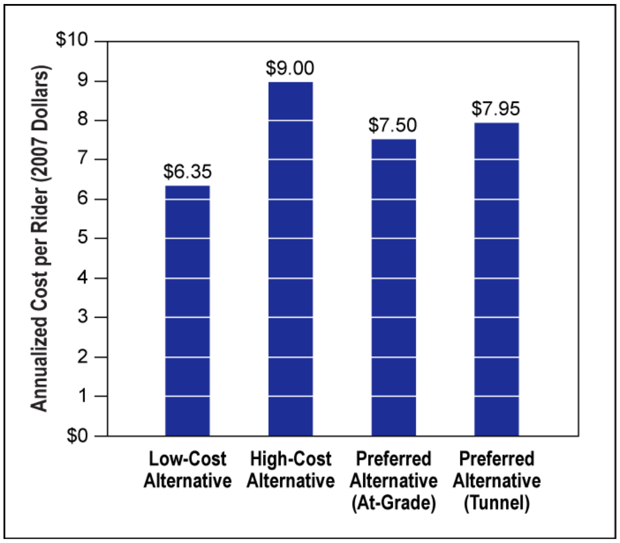

EXHIBIT 6-1
Cost-Effectiveness of Low-Cost and High-Cost Projects

The total project cost-effectiveness would be affected by the cost-effectiveness of each segment; therefore, cost-effectiveness (cost per rider) was calculated for each alternative. However, because this cost per rider does not include the effect of travel time on riders not originating in or destined for stations within a segment, it understates the benefit that faster alternatives offer to through-riders. For this reason, the project appears to be more cost-effective than the individual alternatives. Exhibit 6-2 shows the range of cost-effectiveness for each alternative. In general, comparisons should only be drawn between alternatives within the same segment. Also each alternative contains a range in the cost-effectiveness calculation (in Exhibit 6-2, dark blue shows low range and green shows high range) due in part to the variation in cost and ridership dependent upon the connections from the alternatives in the adjacent segments or various design options within the alternative. For some alternatives, the range is so small that the rounding to the nearest five cents per rider removes the appearance of a range.

Segment A

The only alternative within Segment A, *Preferred Alternative A1,* has two options on the D2 Roadway— light rail only or joint operation with bus traffic. The cost-effectiveness is estimated to be $12.20 per rider for light rail only and $12.60 with joint operations. The additional cost of the D2 Roadway joint operation design option would slightly reduce the cost-effectiveness of *Preferred Alternative A1*. There would be no additional light rail riders due to this design option; however, it would offer some bus travel-time savings.

Segment B

In Segment B, *Preferred Alternat*ive *B2M* is in the median range of cost-effectiveness, at $8.80 per rider for *Preferred Alternative B2M* to *C11A* and $8.20 per rider for *Preferred Alternative B2M* to *C9T*. Alternative B7 is the least cost-effective; at $30.35 per rider, Alternative B7 is about four times higher than the other alternatives in this segment. This is primarily a result of the lower segment ridership as compared to the other alternatives. Alternative B7 would have roughly one-quarter of the segment riders than the other alternatives within Segment B, which are reasonably comparable to one another in cost-effectiveness. While Alternative B1 appears to be to most cost-effective at $7.00 per rider, its combination with Alternative C1T does not support this conclusion. Therefore Alternative B2A remains the most cost-effective at $7.30 per rider.

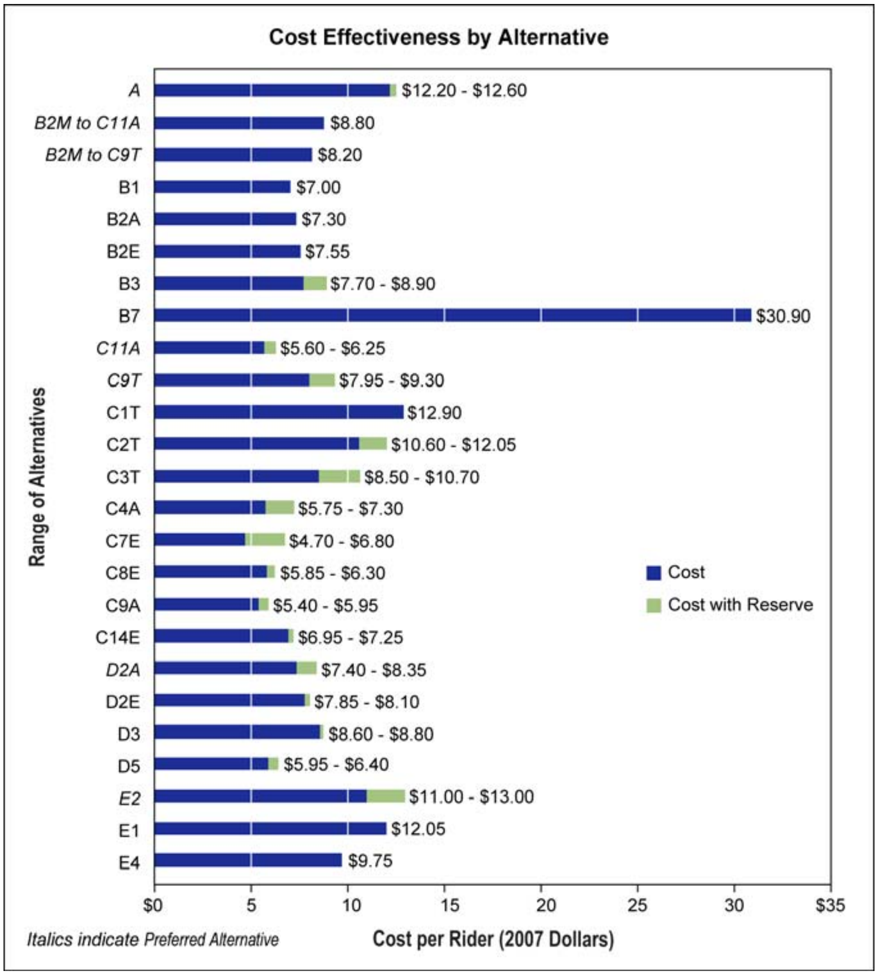

EXHIBIT 6-2
Cost-Effectiveness by Alternative

Segment C

In Segment C, P*referred Alternative C11A* and Alternatives C4A, C7E, and C9A are the most cost-effective alternatives because they are relatively low cost with high ridership. Alternatives C8E and C14E fall in the middle of cost-effectiveness. The at-grade and elevated alternatives are almost one-half the cost of the highest-cost alternative—Alternative C1T. Tunnel alternatives generally have higher costs per rider than at-grade or elevated alternatives. Tunnels are inherently costlier, and therefore, unless they provide substantially higher ridership, they would have a high cost per rider. *Preferred Alternative C9T* is the most cost-effective tunnel alternative when combined with a connection from 112th Avenue SE (*B2M*, B2A, or B2E). The bored tunnel connection from Alternative B2A (via Surrey Downs Park) for Alternatives C2T and C3T adds cost and is therefore less cost-effective than the B2E connection. However, connecting from Alternative B7 is still the least cost-effective connection for these alternatives, as represented in Exhibit 6-2. For Alternatives C4A and C7E, the connection from Alternative B2E provides the best cost-effectiveness per rider, as shown by the top of the blue bar, and Alternative B2A proves to be the least cost-effective for these alternatives.

Segment D

The Segment D alternatives have similar cost-effectiveness because each has similar ridership and costs, except for Alternative D5, which is the most cost-effective. *Preferred Alternative D2A* and Alternative D2E are the next most cost-effective. The D2A - 120th and NE 24th Design Options result in nearly $1 more per rider over *Preferred Alternative D2A*. However, even with the design option, it remains more cost-effective than Alternative D3.

Only a slight difference is attributed to the connection from Segment C alternatives, either passing via NE

12th Street or from the former BNSF Railway corridor. The NE 12th Street connection is more cost-effective for all Segment D alternatives (as illustrated by the top of the blue bar), except for Alternative D5, where the connection via the former BNSF railway is the most cost-effective. The cost-effectiveness as illustrated in Exhibit 6-2 does reflect the potential for increased ridership in Segment D attributed to the Bel-Red corridor by the Cities of Bellevue and Redmond land use plans.

Segment E

Ridership in this segment would be similar for all alternatives, so cost-effectiveness is directly correlated to cost. Alternative E4 is the most cost-effective, with *Preferred Alternative E2* second (as shown in Exhibit 6-2), mostly because Alternative E4 has slightly higher ridership over *Preferred Alternative E2*. However, the E2 - Redmond Transit Center Station Design Option with *Preferred Alternative E2* is the least cost-effective because it is the highest-cost alternative with an extra station and high property acquisition costs.

6.2 Comparison of Benefits and Environmental Impacts

The East Link Project as a whole would improve transit quality in the region by providing frequent and reliable HCT service 20 hours each day in the Seattle, Mercer Island, and Bellevue to Redmond corridors. East Link passengers would receive a comfortable ride; high-person capacity; efficient loading of multiple-car trains resulting in short in-station loading time; and dependable, on-time departures and arrival. This increase in reliability between major transit centers would enhance the network of bus distribution and feeder routes, thereby enhancing the ability of transit riders to reach a broader range of destinations in less time than they can now. The East Link Project would be made up of a selection of one alternative from each segment. This section describes the trade-offs among the benefits, impacts, and cost-effectiveness of the alternatives.

Segment A does not have multiple build alternatives, but the design option of shared use of the D2 Roadway has higher cost trade-offs against somewhat worse bus transit performance if shared use is not accommodated.

In Segment B, the 112th SE alternatives (*Preferred Alternative B2M* and Alternatives B2A and B2E) offer the highest ridership levels and cost-effectiveness with relatively low environmental impacts and construction risk. Construction may result in potential impacts on the Winters House under *Preferred Alternative B2M*; however, mitigation measures would protect and preserve the house. All Segment B alternatives would affect Mercer Slough Nature Park. The Bellevue Way Alternative (B1) would have the most residential property acquisitions, whereas the BNSF Alternative (B7) is the longest alternative, and would result in the highest level of wetland impacts and most expensive. All Segment B alternatives would result in traffic and noise impact, as well as a loss in some high-value habitat. However, these impacts can be mitigated. All Segment B alternatives that follow Bellevue Way SE, except *Preferred Alternative B2M,* would result in visual impacts from the removal of mature vegetation and retaining wall on the west side of the roadway. Except for B7, which is substantially worse, cost-effectiveness is generally similar among these alternatives.

In Segment C, the tunnel alternatives would generally provide the highest ridership but also have a higher construction risk and worse cost-effectiveness than the at-grade and elevated alternatives. Because they are underground, tunnel alternatives avoid interactions with traffic and decrease noise that the at-grade and elevated alternatives might have during operation. However, tunnel alternatives would have considerably longer construction periods and extensive soil excavation and removal. At-grade alternatives also attract high ridership, but the travel time may be compromised unless signal priority can help facilitate traffic movements through Downtown Bellevue. Alternatives C4A, C3T, C8E would result in a long-term visual effect on McCormick Park, and if connected with B2A, Alternative C9A would result in visual impact on 112th Avenue SE. All alternatives in Segment C, except C7E or C14E, would affect parks. Both *Preferred Alternatives C11A* and *C9T*, as well as other at-grade and cut-and-cover tunnel alternatives would have a high degree of utility relocation within constrained right-of-way, but the cut-and-cover tunnel alternatives would require a construction period at least one year longer, with associated transportation impacts. While P*referred Alternative C11A* and Alternative C9A are the most cost-effective, *Preferred Alternative C9T* would avoid interacting with automobile circulation in Downtown Bellevue. Connecting from *Preferred Alternative B2M* would require relocating several residences but remain less costly than connections from Alternatives B3 or B7 that would result in higher ecosystem impacts.

The primary impacts of the Segment D alternatives would be on businesses and land uses. Although all Segment D alternatives would cross several streams, impacts on habitat would be minimal and in some cases beneficial with mitigation. Alternative D3 would displace the most businesses and employees and have the greatest estimated cost. It would also have slightly lower ridership than the NE 16th alternatives (*Preferred Alternative D2A* and Alternative D2E). Alternative D5 has the lowest estimated cost but because of its location adjacent to SR 520, it would have the fewest stations and the least influence on transit-oriented development opportunities in the Bel-Red Subarea. The *Preferred Storage Track connection from D2A* would not result in any relocations nor would it contribute notable environmental impacts.

The Segment E alternatives would not substantially differ in ridership. *Preferred Alternative E2* is the second most cost-effective, after the shortest alternative (Alternative E4). Alternative E4 would result in visual impacts on the entry to Redmond Town Center, and the residents over Sammamish Way Boulevard would experience a change in their viewshed from the only alternative that would require relocation of a historic structure. The E2- Redmond Transit Center Design Option would provide an additional station when extended to the Redmond Transit Center, it would also have the greatest impact in many categories: the highest estimated capital cost, the most business and employee displacements, and the highest impact on parks. Alternative E1 would have the highest habitat impacts but the lowest impact on parks.

MF5 would be the maintenance facility most compatible with adjacent land uses because it is located in an area planned to remain industrial in the future. Near the areas of MF1, MF2, MF3, the land uses will eventually shift away from industrial uses to more mixed residential and commercial uses. MF1 and MF3 would also be more expensive to construct and would displace substantially more businesses than the other potential maintenance facility locations. In addition, MF1 would be located adjacent to medical offices and the new Children's Hospital Bellevue Clinic and Surgery Center, which are more sensitive to noise and vibration than industrial uses. The greater cost for MF1 and MF2 would be related to greater amounts of excavation and grading required to make these sites level. MF1 and MF3 would have the most potential employee displacements, with over 900, while MF5 would be the least costly maintenance facility and could have the fewest employee displacements, with as few as 320. The fewest business displacements would occur under MF2, which would displace three to six businesses, depending on which alternative it connects from.

6.3 Areas of Controversy and Issues to be Resolved

Sound Transit would continue to coordinate with appropriate federal, state, and local agencies and jurisdictions to resolve issues as the project advances. East Link project areas of controversy and issues that remain to be resolved include the following:

- Choosing between the alternatives that follow the former BNSF Railway corridor and alternatives along Bellevue Way SE. The City of Bellevue has indicated a preference for a modified version of Alternative B7 and C9T, referred to as the B7R (described in Chapter 2), and the Sound Transit Board's *Preferred Alternative B2M* follows Bellevue Way SE and 112th Avenue SE.
- In Segment C the City of Bellevue and Sound Transit are coordinating to find funding to build the higher-cost *Preferred Tunnel Alternative* (*Preferred Alternative C9T*) instead of the lower cost at-grade *Preferred Alternative* (*Preferred Alternative C11A*).
- Since publication of the 2008 Draft EIS, a lawsuit was filed challenging the State of Washington's constitutional authority to approve transition of the I-90 floating bridge center roadway to light rail transit use. In April 2011 the Washington State Supreme Court denied the petitioner's request to prohibit the State from authorizing this transition. Following the Supreme Court's decision, the petitioner filed a similar challenge in Kittitas County Superior Court.
- The alignment of *Preferred Alternative E2* in Downtown Redmond as shown in Appendix G1 (Conceptual Design Drawings) and the City of Redmond's *Central Connector Master Plan* adopted in June 2011 are not entirely consistent primarily because of city plans for utility upgrades and the regional trail extension in the former BNSF Railway corridor and NE 76th Street rights-of-way. Sound Transit has obtained real property and easements for the right to operate light rail in the former BNSF Railway corridor from the Port of Seattle and the City of Redmond, which guarantees Sound Transit access to the Downtown Redmond segment of the corridor for light rail. When funding is available to advance Segment E, Sound Transit will coordinate with the City of Redmond to resolve design issues in this corridor. Solutions may include acquisition of additional property, relocation of utilities, modifications to NE 76th Street, and/or modifying the light rail alignment in Downtown Redmond.

Chapter 7

Public and Agency Comment Summary

7.1 Introduction

This chapter summarizes comments received on the East Link Project Draft Environmental Impact Statement (Draft EIS) and the Supplemental Draft EIS (SDEIS). It is intended to serve as a summary only; it is not intended to address every comment received during the Draft EIS and SDEIS comment periods. All comments received and responses to those comments are included in Appendix J of this Final EIS.

The U.S. Department of Transportation (USDOT) Federal Transit Administration (FTA), the Central Puget Sound Regional Transit Authority (Sound Transit), and Washington State Department of Transportation (WSDOT) published the East Link Project Draft EIS on December 12, 2008. The 75-day extended comment period ended on February 25, 2009. The general public, business groups, organizations, and agencies submitted comments by mail, e-mail, and on comment forms provided by Sound Transit. Oral statements were also recorded during the following five public hearings and open houses:

- Wednesday, January 21, 2009, Old Redmond Schoolhouse Community Center, Redmond
- Thursday, January 22, 2009, Thurgood Marshall Elementary School, Seattle
- Tuesday, January 27, 2009, Community Center at Mercer View, Mercer Island
- Wednesday, January 28, 2009, Bellevue High School, Bellevue
- Thursday, January 29, 2009, Bellevue City Hall, Bellevue

Following this process, the FTA, Sound Transit, and WSDOT published the SDEIS and opened a public comment period for this document between November 12, 2010, and January 10, 2011. Oral statements were recorded on Tuesday, November 30, 2010, at Bellevue City Hall in Bellevue.

This summary provides an overview of the comments received by segment, by public agencies, and by organizations. Table 7-1, located at the end of this chapter, provides a review of common comments and responses.

7.2 Overview of Comments Received

7.2.1 Draft EIS Overview

Sound Transit received 765 comment submittals or individual statements on the Draft EIS during the comment period. The comments covered a wide range of issues and represented viewpoints from residents, property owners, organizations, business groups, businesses, and government agencies. Most comments generally supported East Link but expressed preferences or opposition to specific alternatives. Of the 765 submittals, approximately 170 generally supported or opposed the project and did not advocate or oppose a particular alternative. Most comments came from individuals living, working, or with property interests in the project study area. Most commenters referenced one or more segments of the project area and stated a preference or objection to one or more alternative. Over half of the comments submitted were regarding Segment B (South Bellevue).

Overwhelmingly, transportation issues were the top concern, related to congestion, parking, access limitations, transit ridership, or pedestrian and bicycle issues. Other common issues of concern included noise and vibration, property acquisition and property values, visual effects, land use, neighborhoods, parks, ecosystems, construction, and project financing and cost. Specific suggestions for new alternatives or modifications to the proposed alternatives in the Draft EIS were made in approximately 110 submittals. Approximately 75 submittals included comments that suggested fundamental changes to the East Link Project. Examples of these comments included using different technologies for high-capacity transit (HCT), developing a bus rapid transit system instead of light rail, and providing HCT to the Eastside along different corridors, such as State Route (SR) 520.

The following lists how many comment submittals referenced each segment, summarizes the general comments received from individuals on the segment, describes which segment alternatives received the largest number of supportive comments, and highlights which segment alternatives received the most endorsements from organizations and agencies.

7.2.1.1 Segment A, I-90

Approximately 60 submittals were received, and most of the comments concerned the transportation operations of I-90. Because the East Link Project would convert the center roadway from vehicle operations to an exclusive rail corridor, several comments expressed concern that losing the center roadway would potentially create additional congestion and freight impacts. Even with the additional high-occupancy vehicle (HOV) lanes to be built as part of the I-90 Two-Way Transit and HOV Project, comments listed concerns about how the new HOV lanes will meet traffic flow performance measures. Additionally, several comments questioned how Mercer Island residents would safely weave into and out of the I-90 lanes. Most comments regarding the D2 Roadway supported joint use of bus and light rail on this roadway between Seattle and the Rainier Station.

Concerns about both stations in Segment A focused on adequate parking and spillover on-street parking in adjacent neighborhoods. Several mentioned issues about possible congestion on residential streets and potential pedestrian impacts surrounding stations. Mercer Island preferred the station design with entrances on 77th and 80th rather than with the pedestrian bridge, with the understanding that Sound Transit will work with the City to address park-and-ride capacity. Most comments supported an elevated light rail profile that retains the South-to-West on-ramp, but commenters generally saw less need for the East-to-North off-ramp.

Some comments also suggested analyzing a trans-lake alternative that did not use I-90. Some suggested that commuters would be accommodated in the SR 520 Bridge Replacement and HOV Project.

7.2.1.2 Segment B, South Bellevue

Of the over 400 comment submittals received regarding Segment B, most discussed the BNSF Alternative (B7), with almost 250 supporting this alternative and at least 70 opposing it. Some commenters sent multiple comment submittals. Over 200 commenters referenced transportation concerns in Segment B, more than any other segment. Comments on Segment B generally fell into two categories: those supporting and those opposing the use of the former BNSF Railway corridor.

Those supporting use of the former BNSF Railway corridor also fell into two general categories. The first type of support was oriented toward the ability to extend light rail to the east and south in the future—specifically to Eastgate, Issaquah, and Factoria, which many believe would be easier from this right-of-way. These supporters also felt that use of existing right-of-way would be a better use of money and that crossing Mercer Slough now as part of East Link would ultimately save money, rather than crossing it in the future to expand the light rail system to the east and/or south. Nearby access to I-405 was also cited in many submittals.

The second type of support for use of the former BNSF Railway corridor was based on opposition to running light rail along Bellevue Way SE and/or 112th Avenue SE. Opposition to using these roads generally focused on potential residential and business displacements, noise impacts, visual impacts, increased traffic, and impacts on neighborhood cohesion. Additional concerns include the potential for increased crime, impacts on property values, and impacts on parks. These concerns were related to both construction and operation of the project.

Commenters expressed concern about whether or not construction mitigation proposed with any of the alternatives along Bellevue Way SE was adequate. Another concern was future land use opportunities in this area, as some people believe that all available right-of-way should be preserved for future road widening and others are concerned that upzoning would occur, resulting in increased density around stations. A number of the supportive comments asserted that Alternative B7 is more consistent with the Bellevue Comprehensive Plan, the South Bellevue Subarea Plan, Bellevue Light Rail Best Practices, and the Bellevue Chamber of Commerce. Many commenters opposed to the Bellevue Way SE alternatives also questioned the ridership forecast for Alternative B7 and felt that ridership for this alternative was underestimated. In addition, at least 50 submittals expressed support for a proposal developed by the "Vision Line Coalition," which includes Alternative B7.

Comments that opposed using the former BNSF Railway corridor for Alternative B7 focused on the proximity of residences to this right-of-way, which they believed would result in potential noise impacts, potential impacts on property values, and traffic impacts on 118th Avenue SE. They also referred to the projected low ridership and, therefore, low cost-effectiveness of this alternative. Several comments acknowledged that transit access is not convenient in this area and that there are limited opportunities for people to walk to a station. Some commenters felt that locating the 118th Station's near I-405 would actually promote driving rather than walking to the park-and-ride. Many residents along this corridor expressed concern about changes in this area related to the current expansion of I-405, leaving a more limited area for light rail to occupy, and that use of the former BNSF Railway corridor for light rail might preclude other future uses, such as a trail or commuter rail. Other comments opposed Alternative B7 due to potential impacts on wetlands and habitat in Mercer Slough Nature Park and on the Mercer Slough Environmental Education Center.

Both supporters and opponents of Alternative B7 were concerned about construction in Mercer Slough related to geological hazards, including construction of the South Bellevue Station and park-and-ride lot expansion (supporters) and construction across the slough (opponents).

Over 80 comment submittals specifically opposed the Bellevue Way Alternative (B1), due to the potential high number of relocations, neighborhood impacts, impacts on businesses, and limited connections in Segment C. Over 30 submittals supported this alternative, however, because of its service to denser residential and business areas. At least 40 submittals supported the 112th SE Alternatives (B2A, B2E, and B3) because of lower cost, better access to downtown, use of the South Bellevue Park-and-Ride, and the grade-separation of elevated sections to benefit traffic operations and increase safety. Several commenters suggested moving the 112th SE Bypass Alternative (B3) off of Bellevue Way SE and 112th Avenue SE corridors and placing it on the eastern edge of Bellevue Way's right-of-way to minimize potential roadway impacts. Most comments supported an elevated light rail profile that retains the South-to-West on-ramp, but commenters generally saw less need for the East-to-North off-ramp.

In addition to individuals, the following agencies or organizations voiced preferences about the following alternatives:

- At the time, Alternative B3 was supported by the City of Bellevue (if modified), Sierra Club, and Bellevue Downtown Association (if modified). Proposed modifications to this alternative focused on moving the light rail to the east side of Bellevue Way SE and 112th Ave SE. Several organizations expressed support for any Bellevue Way SE alternative, including the Town of Beaux Arts Village, Puget Sound Energy, Puget Sound Regional Council, State Department of Ecology, and condominiums along 118th Ave SE (Brookshire and Mercer Park).
- Alternative B7 was supported by Surrey Downs and Bellecrest neighborhood associations, Bellevue Chamber of Commerce, Bellevue Downtown Association, Eastside Transportation Association, Condominiums along 112th (Bellefield Residential Park and Carriage Place), and Vision Line Coalition.

7.2.1.3 Segment C, Downtown Bellevue

Approximately 250 comment submittals discussed Segment C. They generally focused on the type of profile: tunnel, at-grade, or elevated. The general preference was for a grade-separated alternative through downtown. More comments supported tunnels than opposed them, while more opposed at-grade and elevated profiles than supported them. Opposition to tunnels primarily focused on higher costs and risk, while support focused on higher ridership, a perception of less disruption during construction, and long-term compatibility with an urban environment. Traffic flow in Downtown Bellevue was referenced by over 80 commenters, mostly as support for why tunnel alternatives are necessary in this segment. Second most important among commenters was the view that tunnel alternatives would produce higher ridership, which would support long-term growth plans with less disruption to traffic.

Of the tunnels, the 106th NE Tunnel Alternative (C2T) received the greatest support (over 50 comment submittals); comments indicated that Alternative C2T would offer better access to the Wilburton Subarea on the east side of I-405 and avoid impacts north of downtown on businesses and neighborhoods. Other comments opposed Alternative C2T because of the extensive cut-and-cover construction in downtown and impacts on NE 6th and the Meydenbauer Convention Center. The 108th NE Tunnel Alternative (C3T) was favored by many because of the high ridership, fastest service through downtown, less construction disturbance, and the additional station it provides, which would serve the north downtown area.

The location of the Hospital Station (Alternatives C1T and C2T) was generally preferred over the Ashwood/Hospital Station, including by Overlake Hospital, Group Health, and Children's Hospital, although they indicated either station could work well for them. However, the Bellevue Way Tunnel Alternative (C1T) was unpopular because of the number of relocations and the construction disruption associated with a cut-and-cover tunnel. Potential park impacts from tunnel portals in Surrey Downs Park associated with Alternatives C2T and C3T and in McCormick Park associated with Alternative C3T were also identified as concerns in many comments.

Comments regarding the at-grade Couplet Alternative (C4A) generally opposed it because of longer travel time; impacts on business, surface traffic, property access, and pedestrian and vehicle safety; and the ability of this alternative to accommodate long-term traffic operations. Supporters for Alternative C4A liked the accessibility and lower cost of this alternative compared to tunnels and felt that it would not have the impacts of elevated alternatives. While most comments received on the 112th NE Elevated (C7E) and 110th NE Elevated Alternatives (C8E) were opposed to them because of visual, noise, and community impacts, others supported the elevated alternatives because of lower cost and faster travel times.

Several submittals expressed opposition to alternatives that use the Ashwood/Hospital Station (C3T, C4A, C7E, and C8E) because of the high number of business displacements (primarily medical offices) that would occur for construction staging. Several commenters felt the Old Bellevue and East Main Stations were unnecessary, while some supported these locations because of potential for future growth in these areas. In addition, at least 50 submittals for the Vision Line Coalition supported Alternative C2T.

In addition to individuals, the following agencies or organizations voiced preferences about the following alternatives:

- Alternative C2T was supported by City of Bellevue, Bellevue Chamber of Commerce, Eastside Transportation Association, Puget Sound Energy, Vision Line Coalition, and City of Snohomish.
- Alternative C3T was supported by the Bellevue Downtown Association.
- Alternative C4A was supported by Microsoft and Sierra Club.
- Both the City of Redmond and Redmond Chamber of Commerce supported affordable options, whether the alternative was at-grade or elevated. Meydenbauer Convention Center opposed Alternatives C1T and C2T.

7.2.1.4 Segment D, Bel-Red/Overlake

Approximately 90 parties commented on Segment D. Most comments related to specific alternatives in Segment D. Primary concerns raised in the comments were related to transportation and the built environment. Transportation comments included concerns regarding congestion, parking, and traffic impacts during construction; ridership; and reduced access to business properties. Other major built environment comments included concerns related to property acquisition, consistency with future land uses, noise and vibration impacts on medical equipment operation, visual impacts, and property value impacts. Comments regarding the natural environment included concerns about creeks and loss of trees. Project costs and economic impacts for specific alternatives were also mentioned frequently.

The NE 16th At-Grade Alternative (D2A) received the greatest support (over 35 comment submittals). Supporters of Alternative D2A noted that it would support redevelopment of the Bel-Red area consistent with the City of Bellevue’s land use vision. Transportation operations were commonly referenced in support of Alternative D2A because this alternative would have the highest ridership, align with Bellevue and Redmond long-range planning goals and objectives, and avoid congested streets. The few commenters expressing opposition to Alternative D2A cited increased property impacts and the cost of this alternative. Over 20 comment submittals supported the NE 16th Alternative (D2E) because of fewer impacts on specific properties, service to greater numbers of people and businesses, similar benefits to transportation operations mentioned for Alternative D2A, and the elevation over creeks. Concerns expressed regarding Alternative D2E included its higher cost relative to Alternative D2A and its visual and property value impacts.

More comment submittals (over 20) opposed the NE 20th Alternative (D3) than supported it. Many of these commenters represented medical offices and facilities, and they noted noise and vibration impacts on medical equipment and patients. Other businesses also expressed concern regarding Alternative D3 property impacts and loss of trees and buffer area. Comments regarding the SR 520 Alternative (D5) cited its inconsistency with the land use plans for the area and lack of ridership. Others noted that this alternative would provide greater opportunity to attract riders from other Eastside communities and result in fewer impacts on existing businesses. Of the approximately 20 submittals expressing a preference for this alternative, approximately half supported and half opposed it.

Several commenters felt that light rail ridership estimates in Segment D should be updated to include the growth numbers included in the newly adopted Bel-Red Corridor and Overlake Neighborhood land use plans. There were a number of comments concerned about the current overcapacity of the existing Overlake Transit Center park-and-ride lot and the perception that no additional parking spaces would be provided through the East Link Project. Additionally, concerns were expressed about the perceived traffic congestion around the vicinity of the Overlake Transit Center that would occur during light rail construction and operation.

In addition to individuals, the following agencies or organizations voiced preferences about the following alternatives:

- Alternative D2A was supported by the City of Bellevue, Bellevue Chamber of Commerce (if modified), Bellevue Downtown Association (if modified), City of Redmond, Transportation Choices Coalition, Vision Line Coalition (if modified), Puget Sound Energy, and Sierra Club.
- The City of Redmond supported Alternative D2A and Alternative D2E and also requests continued evaluation of the portion of Alternative D5 in the Overlake area.

7.2.1.5 Segment E, Downtown Redmond

Approximately 90 parties submitted comments related to Segment E. Most comments referred to specific alternatives and most pertained to built environment impacts from the alternatives, primarily visual impacts and noise impacts on residences. Comments regarding natural environment impacts were also common and included issues related to the Sammamish River, vegetative buffers, and the removal of trees.

More commenters (over 20) expressed objection to the Redmond Way Alternative (E1) than supported it (less than 10), citing traffic congestion along West Lake Sammamish Parkway and potential impacts on residences such as property value decreases, property acquisitions, noise impacts, and visual impacts. Natural environment concerns were also noted for this alternative. Those in support of Alternative E1 noted that it would best serve people coming from the east of Downtown Redmond and would have fewer ecosystem impacts than other Segment E alternatives.

Marymoor Alternative (E2) received the most support, approximately 35 submittals, with commenters noting relatively fewer impacts on residents, including less visual and noise impacts, fewer acquisitions, and reduced traffic. Several commenters preferred this alternative because it would follow an existing transit corridor, offer better accessibility, and include stops at Redmond Town Center and Redmond Transit Center. The few commenters opposed to this alternative expressed concern regarding traffic congestion and parking impacts.

Comments regarding the Leary Way Alternative (E4) noted concerns based on property acquisition, property value decreases, and roadway access. Specific property impacts mentioned include displacement of the Justice William White House, a historic resource; impacts on Redmond Town Center; and removal of the Residence Inn. Visual impacts were also noted, including impacts on the mature trees along the gateway to the city on Leary Way.

Over half of the commenters who discussed Segment E listed transportation issues. Many comments indicated concern about the Redmond Town Center vicinity parking, traffic, and access impacts with East Link. Similar concerns were expressed about current traffic congestion issues within this area, which commenters noted would only get worse with East Link. Their feeling was that station locations could encourage more drivers to come into Redmond, which could exacerbate traffic and parking problems. Similar comments expressed the importance of park-and-ride lot locations and their capacity because these facilities can directly affect traffic management and pedestrian access.

In addition to individuals, the following agencies or organizations voiced preferences about the following alternatives:

- Alternative E2 was supported by City of Redmond, Greater Redmond Chamber of Commerce, Microsoft, Transportation Choices Coalition, Puget Sound Regional Council, Puget Sound Energy, City of Snohomish, Redmond residents, and Marymoor Heights Condominium.

7.2.1.6 Maintenance Facilities

Approximately 12 comments mentioned the maintenance facility alternatives. Comments cited the inconsistency of the 116th, BNSF, and SR 520 maintenance facilities (MF1, MF2, and MF3) with Bellevue land use plans in the Bel-Red area. Some property owners were concerned about impacts on their property from MF1, MF2, MF3, and SE Redmond Maintenance Facility (MF5). Other commenters noted the property acquisition impacts that MF3 would have. One comment regarding MF5 noted the cost savings of this alternative and another noted the consistency of this alternative with land use plans. One commenter questioned the potential for hazardous materials spills at maintenance facilities.

7.2.1.7 Suggestions for Modified and New Project Alternatives

Approximately 75 submittals included comments that did not refer to the East Link Project as defined in the Draft EIS. Some of these comments questioned the project as light rail, instead suggesting that bus rapid transit (BRT) would provide high-capacity transit between the Eastside and Seattle in a less costly manner with fewer impacts. Others stated that the SR 520 corridor would better provide this connection for light rail. Comments expressing a preference for light rail connections to Factoria and Eastgate were also submitted. Other commenters stated that the project did not serve other Eastside communities such as Kirkland and Renton. A couple of commenters questioned the connection of the Eastside to Downtown Seattle rather than directly to the airport or other Eastside communities. Several commenters suggested the use of the LEVX technology, described as a "Zero Energy Permanent Magnet Suspension System and highly efficient Hybrid Non-Contact Linear Drive" for HCT to the Eastside.

Approximately 70 commenters submitted suggestions for modifications to existing alternatives. These modifications were suggested mainly to reduce property acquisitions, neighborhood impacts, business impacts, traffic congestion, or travel time, or to serve specific areas. The following discussion does not include all of the suggestions, but those received more frequently are described.

The City of Bellevue recommended and the Bellevue Downtown Association supported a modified Alternative B3 that would follow the east side of Bellevue Way and 112th Avenue SE, turn east before SE 8th Street, at-grade as much as possible, and then turn east to 114th Avenue SE (becoming elevated) and north to the East Main Station. This alternative, as suggested for study by the City and the Bellevue Downtown Association, would include various mitigations to address the function of Bellevue Way, maintain and improve HOV access from Bellevue Way SE to westbound I-90, and maintain access for Enatai residents. Numerous commenters expressed support for the Alternative B3 modification.

One of the more frequently suggested modifications was termed the Alternative B7/C8E hybrid route, which would follow the Alternative B7 route and then run along 118th Avenue SE to a station near Greenbaum Furniture, and continue north along 114th Avenue SE to Main Street with no additional stations. Continuing past Main Street on 114th Avenue NE, it would enter downtown via a tunnel at NE 2nd Street rather than the elevated proposal. One alternative termed "C8T" was described similarly to the modified Alternative C8E and was also frequently suggested. Several commenters suggested using the former BNSF Railway corridor for longer segments, some all the way through Segment C.

Several commenters suggested modifying Alternative D2A to cross under 120th Avenue NE and 124th Avenue NE with a retained-cut profile and moving this route to the south to reduce property impacts.

7.2.2 SDEIS Overview

Sound Transit received 822 comments on the East Link Project SDEIS during the 60-day public comment period. Comments were received from private individuals, homeowner associations, community organizations, business groups, businesses, and government agencies. Of these 822 comments, 749 were from private individuals, whose comments are summarized here by segment. Comments from government agencies, businesses, residential organizations, and community interest groups are summarized following this general comment summary. The individuals' comments were primarily focused on Segments B and C, and most limited their comments to a specific alternative and were from individuals living, working, or with property interests in the project study area; comments were also received from those citizens with a general interest in the project. Most comments were generally supportive of East Link but expressed preferences for or issues about specific alternatives. A large number of submittals simply expressed support for the project and requested it not be delayed; others requested a delay for more information development on a revised Alternative B7.

The following summary lists how many comments referenced each segment, describes which segment alternatives received the largest number of supportive comments, highlights which segment alternatives received the most endorsements from organizations and agencies, and describes environmental issues raised in the comments. The most frequently mentioned environmental concerns centered on noise impacts on residences, removal of park lands (either Mercer Slough Nature Park or Surrey Downs Park), impacts on traffic along Bellevue Way and Downtown Bellevue, and how these impacts might affect adjacent neighborhoods, such as Enatai, Surrey Downs, or the condominiums adjacent to 118th Avenue SE.

7.2.2.1 Segment A, I-90

Most comments concerned the D2 Roadway's continued joint use with bus and light rail transit, the loss of the center roadway for HOV vehicles and Mercer Island use, and the potential traffic impacts this might have.

7.2.2.2 Segment B, South Bellevue

Most individuals commenting on this segment focused on either support for or opposition to *Preferred Alternative B2M* or Alternative B7. A total of 270 letters supported and 90 opposed *Preferred Alternative B2M.*

An additional 4 letters supported any alternative on Bellevue Way SE and 119 additional letters opposed any alternative on Bellevue Way SE. A total of 165 letters supported Alternative B7, while 155 letters stated their opposition to B7. Those who support *Preferred Alternative B2M* generally remarked that it has better access, is more cost-effective, and is more centrally located than Alternative B7. Those that stated preference for Alternative B7 expressed that *Preferred Alternative B2M* would have greater neighborhood impacts, including visual, traffic, noise, and residential relocations, as well as impacts on Mercer Slough and the Winters House. These commenters also remarked that Alternative B7 could be modified to be lower cost, could use the former BNSF Railway corridor, would better allow for future extensions east and south, and would have less neighborhood and ecosystem impacts. Those who stated their opposition to Alternative B7 asserted it would have greater ecosystem and noise impacts, lower ridership, a higher cost, and would be less accessible. Regardless of which alternative they preferred, many commenters expressed concern about impacts on Mercer Slough.

A number of commenters referenced the Alternative B7 study underway by the City of Bellevue, and requested that Sound Transit wait for the release of this report to issue the Final EIS or expressed support for the City's modified Alternative B7, known as B7-Revised or B7-R. A number of individual commenters referenced the study completed by the Building a Better Bellevue organization; this study includes suggestions to lower the cost of Alternative B7. In addition to individuals, specific organizations that also expressed preferences for *B2M* or B7 alternatives are listed below:

- *Preferred Alternative B2M* is supported by entities such as the Muckleshoot Indian Tribe Fisheries Division, Bellevue Club, and Transportation Choices Coalition. A large percentage of the comments supporting *Preferred Alternative B2M* were from individual commenters.
- *Preferred Alternative B2M* and all Bellevue Way and 112th Avenue SE running alternatives are not supported by entities such as Miles Construction NW and Building a Better Bellevue. *Preferred Alternative B2M* is also not supported by entities such as the City of Bellevue City Council, the Vision Line Coalition, and the Surrey Downs Historical Society.
- Alternative B7 is supported by entities such as the Bellevue City Council and the Washington Trust for Historic Preservation for its reduced impacts on the Winters House. A large percentage of the comments supporting Alternative B7 were from individual commenters, many whom live in the Enatai or Surrey Downs neighborhoods.
- Alternative B7 is not supported by entities such as the Transportation Choices Coalition, Meydenbauer Center, YMCA, and Low Income Housing Institute.
- Several community organizations, such as the Surrey Downs Historical Society, Building a Better Bellevue, and the Vision Line Coalition, support a modified Alternative B7. The City of Bellevue City Council also supports Alternative B7 with modifications as summarized in the Public Agency Comments section below.

7.2.2.3 Segment C, Downtown Bellevue

A total of 62 letters supported *Preferred 108th NE At-Grade Alternative (C11A)* and 25 opposed it, while 220 letters supported *Preferred 110th NE Tunnel Alternative (C9T)* and 15 opposed it. Three letters mentioned 110th NE At-Grade Alternative (C9A), all opposing it, and eight letters were received about 114th NE Elevated Alternative (C14E), two supporting and six opposing it. A large number of commenters expressed general support for providing access to downtown and putting stations "where people work and live." Many commenters specifically stated they opposed alternatives that traveled on the edge of Downtown Bellevue.

Many comments were received from residents of the Belle Arts Condominiums, which stated a strong preference for a tunnel alternative rather than a surface street option. Residents were concerned that a surface street option would greatly increase the amount of noise impacts in the area due to train noise and the loss of sidewalk space in front of residences. They expressed that this loss would bring traffic and pedestrian noise closer to the buildings along the route. They were also concerned about safety, which they felt would deteriorate due to the increase in riders at the bus stop located at 108th Avenue NE and Main Street. The Belle Arts community was also concerned with noise associated with an increase in people waiting at the nearby bus stop.

Some individuals listed their concerns over alternatives that travel up 112th Avenue SE because of impacts on Surrey Downs Park and the neighborhood that would be affected by removal of a row of condominiums along 112th Avenue SE for connections to *Preferred Alternatives C11A* or *C9T.*

Most comments expressed preference for a tunnel in order to not restrict future development aboveground and to minimize traffic impacts. Many comments were received that requested Sound Transit continue working with the City of Bellevue on funding for the tunnel. In addition to individuals, following are specific organizations that also listed preferences for *Preferred Alternative C11A* versus *C9T*:

- *Preferred Alternative C11A* is supported by entities such as the Muckleshoot Indian Fisheries Division, the Bellevue Branch of the King County Library, Meydenbauer Center, the YMCA, and the Low Income Housing Institute. The majority of the comments received supporting this alternative were from individual commenters.
- *Preferred Alternatives C11A* and *C9T,* as they are currently designed, are not supported by entities such as the Bellevue City Council and Washington Trust for Historic Preservation. However, the Bellevue City Council does support *C9T* with a portal on 2nd Street rather than on Main Street. *Preferred Alternative C9T* is supported by entities such as the Bellevue Branch of the King County Library, Meydenbauer Center, the Transportation Choices Coalition, King County Department of Transportation, the Red Lion Hotel, the Bellevue Downtown Association, the YMCA, and the Low Income Housing Institute.
- Alternative C9A is not supported by entities such as the City of Bellevue City Council.
- Alternative C14E is not supported by entities such as Transportation Choices Coalition.

7.2.2.4 Segment D, Bel-Red/Overlake

Nine out of ten of the submittals received for Segment D supported *Preferred Alternative D2A,* with most commenters approving of this alternative's new design along SR 520 and Overlake Village Station location. Most commenters, including the Transportation Choices Coalition, were supportive of *Preferred Alternative D2A* and stated that it would best serve the Bel-Red Corridor and Overlake areas of Redmond and provide the best ridership access. A small percentage of commenters were concerned about impacts on residences and businesses along the *Preferred Alternative D2A* and Alternative D2E guideways, but no letters specifically voiced opposition to any Segment D alternatives. However, the SDEIS did not address other Segment D alternatives. Two individuals submitted comments in support of Alternative D5. In addition to individuals, listed below are specific organizations and businesses that voiced support for *Preferred Alternative D2A*:

- *Preferred Alternative D2A* is supported by entities such as Puget Sound Energy, Microsoft Corporation, the Muckleshoot Indian Tribe Fisheries Division, the Transportation Choices Coalition, and the Greater Redmond Chamber of Commerce. A small number of comments received were from individual commenters, who also supported *Preferred Alternative D2A*.

7.2.2.5 Segment E, Downtown Redmond

One individual submitted comments in opposition to the Downtown Redmond Station and *Preferred Alternative E2* due to concerns over costs and noise and safety impacts at their residence. The only other comments received regarding *Preferred Alternative E2* were from the City of Redmond and the Greater Redmond Chamber of Commerce. These comments are discussed in the Public Agency Comments section below.

- *Preferred Alternative E2* is supported by the City of Redmond.

7.3 Comments Received from Public Agencies

7.3.1 Project Area Jurisdictions

7.3.1.1 Seattle

The City of Seattle did not submit comments on the Draft or SDEIS.

7.3.1.2 Mercer Island

Draft EIS Comments

In the comments received on the Draft EIS, the City of Mercer Island supported the additional mobility that this project would bring the island and the region. The City also maintained that based on the agreements of the 1976 Memorandum of Agreement and the subsequent amendments, they anticipate that Mercer Island will maintain use of the HOV lanes until such time that these access points exceed operational standards. The City did not support the pedestrian overcrossing to the Mercer Island Station, with the understanding that Sound Transit would work with the City to address park-and-ride capacity. The City favored modifying the I-90 Two-Way Transit and HOV Operations Project to provide an eastbound HOV off-ramp at Island Crest Way instead of at 77th Avenue. The City was concerned that existing park-and-ride lots will not be adequate for future ridership demands that would be required to maintain Mercer Island use of the light rail facility. The City looked forward to working with Sound Transit to ensure that pedestrians would be well served, that design guidelines would be upheld, and that construction impacts would be addressed. They were also interested in working with Sound Transit on mitigation for parking impacts.

SDEIS Comments

In the comments received on the SDEIS, the City of Mercer Island stated they were pleased that the I-90 facility within Mercer Island has been recognized for its eligibility for the National Register of Historic Places. Mercer Island is interested in preserving the historical use of the HOV lanes for Mercer Island single-occupancy vehicles in accordance with the 1976 Memorandum of Agreement. They also commended Sound Transit and WSDOT for the continued partnership in resolving issues during this planning process.

7.3.1.3 Bellevue

Draft EIS Comments

The City of Bellevue submitted a letter in response to the Draft EIS summarizing the City Council *Preferred Alternatives*, which included, at that time, a modified Alternative B3 in Segment B, Alternative C2T in Segment C, and *Preferred Alternative D2A* in Segment D. Major themes in their discussion of preferred alternatives include markets served, surface transportation impacts, the ridership analysis, noise impacts, business and residential displacements, and ecosystem impacts. This submittal also included a staff summary letter that summarizes the themes reflected in the City's detailed comments on the Draft EIS. The City staff comments discussed differences in transportation modeling results from their own analyses, additional transportation analysis needed, and other analyses they felt were incomplete or lacking sufficient detail, including neighborhoods, visual quality, parks, critical areas, and construction impacts. The City staff also requested more detailed information about mitigation and the permitting process.

The Bellevue City Council's *Preferred Alternative* was Alternative B3 for South Bellevue, modified to run on the east side of 112th Avenue SE and to turn east before SE 8th Street. The City believed this alternative would be most consistent with local policy objectives and would best meet the City's needs. The Council also felt this modified alternative would help maintain traffic capacity on Bellevue Way SE, minimize impediments to driveways, maintain and optimize regional connections at the South Bellevue Station and have convenient pedestrian and bicycle access to nearby neighborhoods and the I-90 multi-use trail. The City expressed concern about permanent traffic impacts on Bellevue Way SE and suggested mitigation strategies, including grade-separated station access and an additional HOV lane on Bellevue Way. The City commented that they would like to ensure the westbound HOV on-ramp from Bellevue Way SE is preserved. The displacement of transit service with a temporary closure of the South Bellevue Park-and-Ride Lot during construction was a concern.

The City Council felt that Alternative B7 could provide additional long-term regional transit benefits along the I-405 corridor, but ultimately concluded that Alternative B7 presented substantial adverse impacts with limited opportunities for mitigation. However, the Council felt this alternative should receive additional analysis in the Final EIS. The City also recognized that Alternative B7 would create out-of-direction travel for patrons east and south of I-90 and require transit service modifications that would lengthen a rider's travel time and deter users of the regional system. The City Council unanimously rejected Alternatives B1 and B2E because of high levels of potential construction and property impacts. The Council did not support Alternative B2A due to the location of the SE 8th Station and the widening of 112th Avenue SE that would be required. For all Segment B alternatives, the Council opposed the loss of westbound HOV on-ramps at I-90 and would like these ramps preserved.

The Bellevue City Council preferred Alternative C2T in Segment C because it would maximize the regional system, minimize the potential for Downtown Bellevue to be a chokepoint for the system, and allow for future growth and land use opportunities east of I-405. The Council was concerned about the cut-and-cover construction for Alternative C2T and how best to minimize this potential impact as well as the reduction in roadway lanes on NE 6th Street. The City Council rejected Alternative C1T because of high cost, risk, and residential and business displacements. However, the Council did like the location of the Old Bellevue Station associated with Alternative C1T, and proposed that Sound Transit analyze a station at Main Street and 106th Avenue NE with Alternative C2T, in lieu of the East Main Station. Alternative C3T was not preferred by the Council because of the Ashwood/Hospital Station location, the high number of potential business displacements, and potential impacts on McCormick Park.

The Council unanimously rejected Alternative C4A because they feel it would limit capacity in already strained right-of-way and lacks community support. The City believes Bellevue's "superblock" configuration with few streets and narrow 60-foot street right-of-way constrain the ability to add capacity for light rail or vehicular traffic in the future.

Both elevated alternatives were rejected, partially due to visual and potential pedestrian impacts and access conflicts. In addition, the City felt that Alternative C7E would have poor service to most of Downtown Bellevue, and the Alternative C8E columns placed in the medians would cause traffic conflicts.

Within Segment D, the City preferred Alternative D2A because it would advance their long-range goals, whereas Alternative D5 is the least consistent with their long-range planning. The Council was not as supportive of Alternative D2E, even though it follows the same route as Alternative D2A, because it is entirely elevated. They felt an elevated alternative could have potential visual impacts on planned development in the Bel-Red area, and it would have greater cost than Alternative D2A without increasing ridership. The City's transportation concern with Alternative D3 focused on access limitations for commercial properties along NE 20th Street and the potential economic impacts on businesses along this corridor. Finally, the City supported East Link reaching Overlake Transit Center and providing interim transit service from Downtown Redmond to mitigate any potential interim terminus parking and traffic impacts.

The City staff expressed concerns about the land use and growth forecasts as they relate to transportation demand modeling, consistency with Puget Sound Regional Council *Destination 2030*, the Bel-Red Subarea plan, and the Downtown Implementation Plan update. The City requested that additional information be provided in the Final EIS transportation analysis for street operations, access modifications, increased study area, and mitigation. The City staff also expressed concerns about the at-grade downtown operations analysis, including constraints on intersection signal phasing, driveway closures, intersection blockages, and limitations on future roadway system expansion. The City staff felt that an at-grade alternative in Downtown Bellevue may limit its ability to meet long-term vehicle forecast demands for the downtown area because the study area does not include east of I-405.

The City viewed maintenance base MF5 in Downtown Redmond as the most desirable location. The other three maintenance bases evaluated in Segment D are not consistent with the land uses envisioned for the Bel-Red corridor. Furthermore, MF3 would require piping a stream, which is inconsistent with current City of Bellevue policies.

SDEIS Comments

The City of Bellevue submitted two letters in response to the SDEIS, one from the Bellevue City Council and the other from the City of Bellevue Staff. The City Council letter focused on their preferences for alternatives in Bellevue and requested additional information on these alternatives, whereas the City staff provided input on issues with the SDEIS document and the analyses. The Bellevue City Council opposes both *Preferred Alternative C11A* and Alternative C9A and requests that Sound Transit consider their forthcoming study of a revised Alternative B7, "B7-R," before the East Link Final EIS is released. This alternative would include a station at I-90 and Bellevue Way SE, and it would shift the tunnel portal of *Preferred Alternative C9T* to NE 2nd Street. This alternative was not evaluated in either the Draft EIS or SDEIS.

The City Council expressed that the SDEIS does not fully address construction impacts; phasing of construction; and mitigation for related impacts on roadways, historic, parks, wetlands, and other sensitive areas. Another concern of the City Council is the noise impacts during operation and construction of East Link. They request further analysis but acknowledge that Sound Transit will be conducting a best practices study in this area. Finally, by reference, they submitted eight reports conducted and prepared by the City of Bellevue. These reports include peer reviews of the Draft EIS, noise and ecosystems analyses, as well as Bellevue Light Rail Best Practices, Downtown Bellevue VISSIM Analysis, and the South Bellevue Station Alternative Location Analysis.

The City of Bellevue staff provided a detailed list of areas where they would either like additional analysis or suggested changes in the analysis. As an introduction, the City is requesting that the Downtown Bellevue Light Rail VISSIM Analysis be included in the Final EIS transportation analysis, and stated they felt that the slight changes in ridership do not fully reflect the anticipated changes in Bel-Red land use plans; the South Bellevue Park-and-Ride Lot Transportation Analysis warrants additional mitigation detail; and the noise impacts warrant further research of mitigation measures. Additionally, they are concerned that the noise impacts should address park impacts and that the noise analysis methodology may understate the project noise impacts. The City of Bellevue also expressed a desire for a numeric visual assessment rating evaluation and additional visual simulations to capture park impacts and change in the former BNSF Railway corridor.

Overall, the City of Bellevue expressed a desire for more detailed mitigation planning on visual impacts, parks, wetlands, and other sensitive areas, especially for construction phases. They are concerned about construction impacts on neighborhoods and businesses, the relocation of the Bellevue Transit Center, duration and number of lane closures, and the potential damage to the Winters House. They have requested additional information on mitigation, more cross sections in the design drawings, additional analysis of land use goals, and more detail about which parcels are partial versus full property acquisitions. Like the City Council, they too include through reference the multiple reports and peer reviews of the East Link Project developed by the City.

7.3.1.4 Redmond

Draft EIS Comments

The City of Redmond provided general comments as well as indicated the City's *Preferred Alternative*. The City emphasized the importance of managing costs and risks so that East Link can be extended to Downtown Redmond. Alternatives D2A, D2E, and D5 were identified as the alternatives the City would like Sound Transit to continue to evaluate in Segment D for the Overlake neighborhood. For Segment E, the City supported Alternative E2.

The City requested that the Overlake Transit Center be identified as an interim terminus facility, not the ultimate terminus of East Link. To address concerns raised over traffic conditions surrounding the Overlake Transit Center and as partial mitigation for potential construction impacts of an interim terminus at Overlake Transit Center, the City of Redmond recommended increasing the number of parking spaces at the park-and-ride to serve nearby residents, but wants the park-and-ride to be sized appropriately so as not to act as a magnet for regional parking demand.

Additionally, with Overlake Transit Center as an interim terminus, the City of Redmond preferred that the 1,400-space parking structure near the SR 520/202 interchange provide a transit connection with the Overlake Transit Center for Redmond and other users to the east.

The City Council saw advantages with Alternatives D2A and D2E in Redmond's Overlake area because these alternatives are consistent with adopted visions and policies and with planned development in the area. These alternatives would have fewer potential impacts on businesses and utilities, and the aerial alignment over 148th would cost less than tunneling under with Alternative D5. The City expressed concern with these two alternatives because of the potential impacts they would have on traffic operations along NE 24th Street. They also expressed concern with the potential urban design and aesthetics of the aerial structures.

The City saw the potential for few traffic impacts as the main advantage with Alternative D5. Concerns about Alternative D5 included the potential impacts it would have on properties and businesses and potential conflicts with planned SR 520 improvements and a proposed stormwater management facility. They were also concerned with Alternative D5's lower ridership and with the station's potential urban design. Finally, the City noted the costs for tunneling under 148th Avenue NE as a concern. The City requested that the portion of the Alternative D5 route and station north of the Overlake Safeway continue to be considered as an alternative to running along NE 24th Street.

The City of Redmond supported Alternative E2 in Segment E because it would be mostly located in existing rights-of-way, has strong citizen support, and maximizes ridership while minimizing potential cost and impacts. While the City recognized the potential cost, traffic, and property impacts associated with extending Alternative E2 to the Redmond Transit Center, they felt there would also be potential opportunities to mitigate these impacts, such as pedestrian and local transit service connections, that should be investigated before selecting the Redmond Town Center as the terminus.

SDEIS Comments

The City of Redmond supported *Preferred Alternative E2*; however, they noted several changes have occurred since the initial design of this alternative. Namely, Redmond has purchased portions of the former BNSF Railway corridor and adopted the *Redmond Central Connector Master Plan Infrastructure Alignment Plan* on October 19, 2010. This plan includes adding a large stormwater trunk line inside the former BNSF Railway corridor, which constrains available right-of-way to construct the light rail. They requested that Sound Transit reposition the light rail alignment in a larger corridor that includes the former BNSF Railway corridor and the adjacent NE 76th Street right-of-way.

They also requested that Sound Transit locate support facilities and tail tracks in southeast Redmond rather than in downtown, explore water-related issues in the area of SR 520 and Bear Creek Trail, consider future planned access points and trail connections, and consider a multimodal bridge across SR 520 at the Overlake Transit Center. Due to the new connection for Bear Creek Parkway, Redmond is requesting additional transportation analyses at future intersections. The City expressed concern regarding the construction impacts and potential mitigation strategies at Overlake Transit Center, and expressed concerns about noise-related impacts that may not be fully addressed in the Downtown Redmond and Overlake areas. The City also questioned some of the transportation and visual analyses along *Preferred Alternative D2A*.

7.3.1.5 King County

King County Metro Transit

Draft EIS Comments

King County Metro Transit submitted a comment letter on the Draft EIS that focuses on four main issues in the I-90 corridor: use of the D2 Roadway, potential I-90 bus impacts, Mercer Island access and egress for buses, and cross-lake tolling assumptions.

The County commented that if the D2 Roadway is not available as joint use for buses, the increase in bus travel times for routes on the Eastside and routes on 4th Avenue would be unacceptable for transit users. The County believes that the Final EIS analysis should offer alternatives if joint operation is not feasible, such as alternate bus priority pathways or non-D2 Roadway routes for East Link.

King County expressed concern about potential impacts that light rail could have on bus transit service in the I-90 corridor east of I-405 because of East Link's use of the center roadway and D2 Roadway. The County believes the Final EIS analysis should include changes to bus and rail networks and facilities needed to mitigate these potential impacts.

The current interchange design at 77th Avenue SE does not provide direct westbound access to the I-90 HOV lane. King County is concerned that WSDOT might not be able to construct the proposed eastbound direct HOV off-ramp at 77th Avenue. They expressed concern that bus access to enter/exit Mercer Island is limited, and Metro may not be able to provide stops on Mercer Island for I-90 service. During light rail operation this may not be a need with light rail and Sound Transit Route 554 service.

King County Metro Transit also commented about its concern that the Island Crest Way westbound on-ramp could degrade HOV lane performance if single-occupant vehicles are allowed to use the lane, even if they were allowed to use the lane through a HOT lane concept.

The County also expressed concern that the Draft EIS analyzed neither the impacts of tolling on SR 520 in the nearer term (i.e., 2020) nor those of possible tolling on I-90. Because tolling could have a potentially substantial impact on traffic flow, transit ridership, and the speed and reliability of bus travel, King County requested more analysis of tolling be provided in the Final EIS.

SDEIS Comments

In their comments on the SDEIS, King County Metro Transit supported *Preferred Alternatives B2M* to *C9T*. They appreciate that the D2 Roadway would have continued joint use with bus and light rail transit under *Preferred Alternative A1*. Their comments included concerns about how construction might disrupt existing transit facilities and services, especially at transit centers in the study area (South Bellevue Park-and-Ride Lot, Bellevue Transit Center, and Overlake Transit Center), and suggested holding a multijurisdictional meeting to resolve construction coordination issues. Metro would like to reach agreement on construction mitigation prior to the Record of Decision.

King County Department of Natural Resources and Parks, Wastewater Treatment Division, Draft EIS Comments

Draft EIS comments submitted by the Wastewater Treatment Division requested that a reference be included in the Final EIS to a King County Code regarding industrial waste and a King County Public Rule regarding construction dewatering discharge to the sanitary sewer. They described the requirements and approvals to obtain wastewater management and sanitary sewer discharges during construction and operation of East Link. The King County Wastewater Treatment Division did not submit comments on the SDEIS.

King County Library System, SDEIS Comments

The King County Library in Bellevue submitted a comment letter on the SDEIS supporting the *Preferred Alternative B2M* to either *C11A* or *C9T* and supported completing the project as soon as possible.

7.3.1.6 Federal Agencies and Tribes

U.S. Environmental Protection Agency

Draft EIS Comments

The U.S. Environmental Protection Agency (EPA) stated that the Draft EIS was an exemplary environmental review of the East Link Project that communicated benefits of the project over the No Build Alternative and provided quality mitigation measures, such as low-impact development measures for stormwater and an understanding of mitigating residual ecosystem impacts. The EPA offered additional input on aquatic and air quality mitigation measures during construction.

SDEIS Comments

The EPA had no substantial environmental concerns regarding the alternatives analyzed in the SDEIS. In recognition of the differences in support for *Preferred Alternative B2M* in Segment B, EPA suggested explaining why ridership varies so greatly for

Alternative B7, explaining how land uses would be supported by the different alternatives, describing the values and functions of the wetlands potentially impacted, and describing whether the former BNSF Railway corridor can support the operation and also the construction logistics of light rail, freight, and a trail. EPA requested additional information in the Final EIS on the feasibility and engineering solution to the unplanned movement of peat and clay in Segment B, and if Alternative B7 is selected, would like the reasons clearly stated for selecting an alternative with higher impacts on wetlands.

Federal Highway Administration, Draft EIS Comments

The Federal Highway Administration's (FHWA's) concerns on the Draft EIS focused on the feasibility of light rail on the floating bridge and associated air space and lease agreements necessary for temporary and permanent use of I-90 and I-405. FHWA also expressed concern for operational and construction safety measures. FHWA requested additional information on the feasibility of an expansion joint to accommodate light rail, highway operations, and potential safety impacts from the project; safety impacts from construction on I-90; impacts from changes to HOV facilities; and use of the HOV lanes by Mercer Island single-occupant vehicles. They outlined the areas where Sound Transit would be required to receive FHWA approval before progressing, namely, HOV commitments to Mercer Island, feasibility of expansion joints, allowance for pedestrian crossings and stations located over interstates, and locating the substations on FHWA facilities or land owned by FHWA. FHWA did not submit comments on the SDEIS.

Advisory Council on Historic Preservation

In response to the Draft EIS, the Advisory Council on Historic Preservation (ACHP) advised that Sound Transit continue to work with the State Historic Preservation Office to complete the Section 106 consultation. ACHP did not submit comments on the SDEIS.

Muckleshoot Indian Tribe

Draft EIS Comments

The Draft EIS comments from the Fisheries Division of the Muckleshoot Indian Tribe supported alternatives that would have the fewest potential impacts on water resources, including streams and wetlands in the project vicinity. The Muckleshoot Tribe stated its preference for Alternative B1 due to fewer impacts on streams, wetlands, and buffers; Alternatives C1T and C3T east to the Ashwood/Hospital Station or Alternative C8E ; Alternative D2E because it is elevated for most stream crossings; and Alternatives E1 or E4 due to fewer ecosystem impacts. The Muckleshoot Tribe commented that MF1 would cause the least ecosystem impacts and expressed opposition to MF3 based on the relocation of Goff Creek. They requested more assessment of existing stream habitat value, loss of habitat, and the potential impacts of artificial light spilling onto waterways. They also clarified the Tribe's fishing treaty rights in the project area.

SDEIS Comments

The Muckleshoot Indian Tribe supported *Preferred Alternatives B2M, C11A,* and *D2A* (including the D2A - 120th and NE 24th Design Options) analyzed in the SDEIS because they found that these alternatives would have the least impact on streams and wetlands. However, they expressed concerns about information not present in the SDEIS regarding streams and the potential project impacts on fisheries, such as the impacts of lighting on water crossings, construction at stream crossings, lengthening culverts, and maintenance activities that can affect fish habitat and result in barriers for fish passage. They felt that more information is needed on the Sammamish River, Bear Creek, the Unnamed Tributary of Kelsey Creek, and Sturtevant Creek (east of I-405) to properly determine impacts on these streams. They also provided corrections regarding the timing of their fishing season. Additionally, the letter requested that stormwater impacts be offset with improvements to the streams and cautions that impacts on salmonid resources may disproportionately affect the Muckleshoot Indian Tribe.

7.3.1.7 State Agencies

Washington State Department of Ecology, Draft EIS Comments

The Washington State Department of Ecology (Ecology) submitted Draft EIS comments organized by the various programs they manage. For the Water Quality Program, Ecology listed requirements for stormwater runoff and a National Pollutant Discharge Elimination System (NPDES) permit. For the Hazardous Waste and Toxics Reduction Program, Ecology defined hazardous waste requirements; and for the Shoreline and Environmental Assistance Program, they reviewed suggestions for Section 401 water quality certification and suggested changes to water quality references in the Ecosystem Technical Report (Appendix H3). Clarifications on wetland impacts and wetland mitigation measures in both the Draft EIS as well as the Ecosystem Technical Report were suggested. Specific concerns were consistency with shoreline master plan updates (which are still under development); disposal of stockpiled construction material; and emphasis on avoiding alternatives that affect wetlands, the Sammamish River, and Bear Creek. Ecology did not submit comments on the SDEIS.

State Department of Archaeology and Historic Preservation, Draft EIS Comments

The Washington State Department of Archaeology and Historic Preservation (DAHP) submitted a letter in response to the Draft EIS that concurred with Sound Transit's submittal of 45 properties as eligible for listing in the National Register of Historic Places (NRHP), as well as the 332 non-eligible properties. DAHP felt further archaeological investigation would be warranted for the *Preferred Alternative(s)*. DAHP encourages discussion of effects on the NRHP-listed I-90 Bridge, the Endresen Residence, and the Romaine Electric Building and requested more information on the project regarding the INS Building in Seattle.

DAHP stated that they have concerns about project changes that might affect the Winters House and believed that, depending on the alternative chosen and how it is implemented, there could be adverse effects on the Pilgrim Lutheran Church, the potential Surrey Downs historic district, and the former Bellevue Fire Station, all of which are resources within the City of Bellevue. DAHP indicated that Alternative E4 would result in adverse effects on the Justice William White House in Redmond. DAHP did not submit comments on the SDEIS.

7.3.1.8 Regional Public Agencies

Puget Sound Regional Council

Draft EIS Comments

The Puget Sound Regional Council (PSRC) noted in response to the Draft EIS that the proposed East Link Project connects three of the region's cities that contain designated Regional Growth Centers, which are the backbone of the transportation network, and that linking these centers with a highly efficient transportation system is a key objective of its regional plans. PSRC would like the Final EIS to improve the characterization of *Vision 2040*, Sound Transit 2 (ST2), and the expandability of light rail in the future. PSRC would like Sound Transit to emphasize the implications of East Link on land use and the need to serve regional transit centers and assess the maintenance facilities for least energy and labor costs. PSRC opposed Alternatives B7 and D5 because these alternatives do not directly serve planned population areas. They fully supported Alternative E2.

SDEIS Comments

PSRC expressed in their comments on the SDEIS that the current *Preferred Alternatives* analyzed in the SDEIS addressed previous impact concerns they had expressed in comments on Draft EIS. PSRC felt that the alternatives that use the Hospital Station within the former BNSF Railway corridor offer good connectivity for future extensions northward. PSRC emphasized that direct connectivity with regional transit centers are important for encouraging strong ridership and realizing maximum benefit from existing investments in these facilities. PSRC recognized that if the Downtown Redmond Station is the selected terminus, then the transit center might need to be relocated closer to the light rail station. Similarly, PSRC encouraged prioritization of strong pedestrian and bicycle access to each station and specifically mentioned improving pedestrian access across NE 8th Street for the Hospital Station.

Puget Sound Clean Air Agency, Draft EIS Comments

Puget Sound Clean Air Agency (PSCAA) supported the East Link Project Draft EIS for its contribution to increasing choices in mobility. PSCAA wanted to make sure that Executive Order 07-02 Washington Climate Change Challenge is addressed through the assessment of greenhouse gas emissions and that the Final EIS assesses the worst-case air quality scenario. The PSCAA letter included a number of preferred mitigation measures to reduce air quality impacts from construction. PSCAA did not submit comments on the SDEIS.

7.3.1.9 Other Public Agencies

Draft EIS Comments

Three jurisdictions that are not within the study area of the East Link Project corridor submitted comments on the Draft EIS to Sound Transit voicing strong support for the East Link Project. Project-specific comments focused on accommodating station locations that could serve commuters to and from their communities.

The City of Snohomish would feel most served by having stations on the former BNSF Railway corridor where a potential future Eastside Corridor rail service could interconnect with East Link. The stations that seemed most valuable to the City of Snohomish were Redmond Town Center, SE Redmond, and the Hospital Stations. The City of Snohomish also asked Sound Transit to consider increased bus service at the end of the line and building the project between Redmond and Bellevue first.

The City of Issaquah asked that Sound Transit consider the implications of future connections to Issaquah in the development of this environmental review—such as assessing necessary accommodations at the South Bellevue Park-and-Ride and the Mercer Island Station for additional light rail service to include extensions to Issaquah. The City of Issaquah would prefer to have future service be direct to both the Bellevue Transit Center Station and Downtown Seattle.

The Town of Beaux Arts Village supported alternatives that offer a station at the South Bellevue Park-and-Ride because that would provide them with enhanced mobility and access. The Town of Beaux Arts Village was concerned about potential traffic impacts if the westbound HOV on-ramp were removed, but felt that loss of the eastbound HOV off-ramp would not be a significant impact.

The Port of Seattle offered input on two issues regarding the East Link Project: the use of the Eastside Rail Corridor (i.e., former BNSF Railway corridor) and the potential impacts of the project on freight and truck operations in the conversion of the I-90 center roadway to light rail. They would like to make sure that the trail, light rail, and the potential commuter rail could be accommodated in the Eastside Rail Corridor. They also felt that the additional discussions of freight movement and the possibility of mitigating increased travel time for freight movement are necessary.

SDEIS Comments
The Port of Seattle's comments provided an update on the ownership of the former BNSF Railway corridor and their intentions of use within this corridor. In December 2009, the Port acquired the former BNSF Railway right-of-way in King and Snohomish Counties. Following this action, the City of Redmond purchased the Redmond spur portion and Puget Sound Energy acquired an easement in this spur. This action included a signed Memorandum of Understanding between several parties (Port of Seattle, Sound Transit, King County, the City of Redmond, the Cascade Water Alliance, and Puget Sound Energy) that this corridor will be available for public transportation uses, such as HCT or bus transportation. Port of Seattle acknowledged that changes in East Link Project designs would affect the former BNSF Railway corridor, such as the Downtown Redmond Station and the storage track.

7.4 Comments Received from Organizations

Comments on the East Link Draft and SDEIS from organizations have been grouped into those representing businesses, residential, or interest groups.

7.4.1 Businesses and Business Groups

7.4.1.1 Business Groups

- Bellevue Downtown Association
- Bellevue Chamber of Commerce
- Greater Redmond Chamber of Commerce

7.4.1.2 Individual Businesses

- adrugstore.com

- TRF
- Universal Mechanical Service Co.
- Wright Runstad & Company

7.4.1.3 Draft EIS Business Group Summary

Business groups that submitted comments during the Draft EIS varied from individual businesses with concerns about potential impacts on their property to business-sponsored organizations, such as the chambers of commerce from Bellevue and Redmond. Still others who submitted comments are developers desiring to preserve or enhance the vitality of their property or properties.

The Bellevue Downtown Association recommended that Alternatives B3 (if modified), B7, and C3T, and D2A (if modified) be brought forward for further review in the Final EIS, stating that these alternatives are the most consistent with Downtown Bellevue's long-term economic, transportation, and land use goals and balance fewer negative impacts with stronger system ridership. For Segment B, they expressed a preference for Alternative B3 (modified to be east side running) over Alternative B7 but stated that both B3 and B7 should move forward for additional study in the Final EIS. They supported Alternative C3T because it would have the fewest surface mobility impacts during both construction and operation; it is the shortest, fastest and most cost-effective tunnel option and promotes the most ridership; and it avoids the potential impacts associated with cut-and-cover construction and reconstruction of the Bellevue Transit Center.

The Bellevue Chamber of Commerce stated its support for the Vision Line (B7, C2T, and D2A) because of fewer potential impacts on neighborhoods; less traffic impact and business disruption from construction; less property acquisition; fewer park impacts; and its function as a safe, reliable train service to convenient stations. The Chamber urged rejection of Alternative D5 based on the need to preserve SR 520 right-of-way capacity for the Bel-Red corridor and Overlake neighborhood.

The Greater Redmond Chamber of Commerce supported an East Link corridor that is the most affordable, stating that cities that choose any other alternative other than a surface rail line should bear the responsibility of required funding beyond the affordable surface option costs. They also supported Alternative D3 with modifications and fully support Alternative E2. The Chamber was also concerned that efforts be made to relocate impacted businesses in Redmond.

The Meydenbauer Center, Bellevue's convention center, expressed serious concerns with Alternatives C1T and C2T. It was concerned about potential negative construction impacts on NE 6th Street that could affect the operations of the center; long-term traffic impacts due to reduction of lane capacity and access restrictions on NE 6th Street, which is also a primary transit bus access road; and aesthetic quality of the tunnel portal.

Overlake/Group Health/Seattle Children's Hospital stated either the Ashwood/Hospital Station or the Hospital Station could serve their needs. They requested the relocation of the Hospital Station to the north closer to the hospital employee garage, thus allowing for a safer pedestrian crossing of 116th Ave NE at NE 10th Street to maintain traffic flow. The hospitals were concerned about potential emergency vehicle access and traffic impacts with the Ashwood/Hospital Station and the at-grade crossing at 116th Avenue NE. Due to pedestrian safety concerns, the hospitals requested this station alternative include an elevated pedestrian crossing of NE 12th Street.

The Red Lion Hotel objected to Alternative C8E and staging for tunnel alternatives that connect from Alternatives B3 and B7. Additionally, the Bellevue Club wrote several letters and collected over 985 member signatures opposing alternatives traveling up 112th Avenue SE, such as Alternatives B2A and B2E, which connect to above-grade Segment C alternatives, or Alternative B3 that would reduce their parking.

Many, if not most, of the businesses whose property would need to be acquired by one or more alternative expressed concern about these acquisitions. They urged Sound Transit to choose an alternative that spared their property or business due to the hardship that would result from sale and/or relocation. Concerns about potential property impacts were expressed most frequently about the business property impacts in Segment D or the connections to Segment D from Segment C at the NE 12th Street crossing of I-405. This crossing concerned several hospital, medical, and office businesses. While the Redmond Chamber of Commerce favored Alternative D3 because it would result in fewer business impacts, several individual businesses along the NE 20th arterial felt more impacts would result from D3 than would result from Alternative D2A.

Costs and financing issues were raised in the consideration of alternative preferences, or as reasons to build some alternatives over others. Alternative B7 was perceived as the lowest-cost alternative, while others, including different business groups, mentioned that it is the least cost-effective. While tunnels are the most costly, it was also mentioned that tunnels have long life spans and could preserve vitality in Downtown Bellevue.

Economic loss was a frequent concern among business groups listing the economic hardship of lost parking as well as the burden of construction on businesses. Some mentioned concern about the economic impacts of the potential visual impacts on an elevated guideway. Almost equally important among business groups was the possible traffic impacts of the project. Common themes for transportation concerns included potential loss of access, congestion during construction, reduction of roadway capacity, loss of HOV mobility, and overall increase in congestion. Of secondary concern, business commenters listed potential visual impacts of the elevated profile in Segments C and D, and whether or not alternatives met the adopted land use and growth plans in Segments C, D, and E. They also listed concerns about potential noise and vibration impacts on medical diagnostic equipment with Alternative D3.

7.4.1.4 SDEIS Business Group Summary

The Bellevue Downtown Association expressed preference for *Preferred Alternative C9T* because of its speed, safety, reliability, access, proximity to the downtown core, compatibility with downtown land uses, and the ability to keep the Bellevue Transit Center open during construction. The Bellevue Downtown Association requested that the VISSIM Analysis conducted jointly by Sound Transit and the City of Bellevue and graphics of walking distance and visualizations developed during the downtown alternatives study be included in the Final EIS, along with analysis of an entrance to the Bellevue Transit Center Station that is directly adjacent to or within the Bellevue Transit Center. The Bellevue Downtown Association also requested the consideration of including additional video or noise simulations. The Bellevue Downtown Association would like to be involved with Sound Transit and the City of Bellevue regarding mitigation planning, and requests that this planning begin as soon as possible to address long-term noise, access, and other environmental impacts during construction.

The Greater Redmond Chamber of Commerce expressed continued support for the project and specifically *Preferred Alternative D2A*.

Most individual businesses supported the project but had specific concerns regarding impacts on their specific location, primarily related to construction access, noise, and vibration, as well as operational traffic, access, and noise. In Segment C, Beacon Capital Partners expressed concern regarding access to office towers they own. Nickols Realty submitted comments on behalf of commercial tenants at several properties they manage within Segment D, and expressed concerns about future land uses, noise, vibration, access, and traffic impacts. Rosen Properties, which also manages a commercial property in Segment D, had similar concerns as Nickols Realty regarding parking, business displacements, and changes in transportation capacity on local roadways. Property Development Centers, which owns the Safeway Beverage Plant on 124th Avenue NE, expressed concern regarding impacts on their facility from the 120th Station (both retained cut and at-grade) and access to their property.

Two business owners adjacent to the Hospital Station, the Pumphouse Bar and Grill and RBJK Ventures, were concerned with impacts on parking and maintaining access to their businesses during construction and operation. The Pumphouse Bar and Grill was also concerned with noise and vibration impacts, and RBJK Ventures requested more detailed information about displacements.

Some businesses suggested changes to the *Preferred Alternatives*, such as *Preferred Alternative B2M* crossing 112th Avenue SE at SE 15th Street instead of SE 6th Street, as suggested by the Bellevue Club, and placing a station on the west side of 112th Avenue SE near Main Street, suggested by the Red Lion Hotel. Both businesses supported *Preferred Alternative B2M*. Bellevue Lincoln Plaza supported Alternative B7 and expressed concerns regarding noise, traffic, soil conditions, and topography related to *Preferred Alterative B2M*.

Kemper Development Company submitted comments regarding traffic in Segments A and B, land use, access, general operations, and the project Purpose and Need. The Meydenbauer Center expressed support for *Preferred Alternatives B2M, C11A*, or *C9T,* with a preference for *Preferred Alternative C9T,* and expressed concerns about Alternative B7.

Microsoft and Wright Runstad & Company supported the changes to *Preferred Alternative D2A* but also had concerns about utility conflicts on their properties. Puget Sound Energy identified utility conflicts for the alternatives analyzed in the SDEIS. Wright Runstad & Company also suggested deferring the 130th Station and requested the project be constructed at least to the 120th Station, and to keep the project on schedule. Two businesses, Evans Industrial Park and Pine Forest Properties, requested that *Preferred Alternative D2A* be designed to minimize impacts on their properties. Some businesses, including Wright Runstad & Company and Kemper Development Company, believe the ridership estimates in Segment D should be higher based on the planned changes in land use in that area.

Two businesses, Eastside Oral Surgery Associates and Miles Construction NW, supported Alternative B7 and opposed the Bellevue Way SE and 112th Avenue SE alternatives, while Express Construction opposed the entire project.

7.4.2 Residential Groups

- Carriage Place Condominiums Home Owners Association
- Bellecrest Neighborhood Association
- Marymoor Heights Condo
- Bellefield Residential Park
- Brookshire Homeowner's Association
- Mercer Park Condominium Home Owners Association
- Surrey Downs Community Club
- Holly Tree Lane Home Owners Association
- Belle Arts Board of Directors

7.4.2.1 Draft EIS Residential Group Summary

There were three predominant segments where residential groups organized to voice their opinions collectively on the Draft EIS: Segments B, C, and E. In Segment B, the residential groups were divided among those who opposed alternatives that used Bellevue Way SE and 112th Avenue SE, thus preferring Alternative B7, and those who opposed B7. The listed concerns for both groups included a potential change in their quality of life, including property acquisition and/or loss of property value, noise, vibration, safety at stations located near neighborhoods, and visual intrusion. Both groups felt that traffic would worsen on the main arterials serving their neighborhood: Bellevue Way SE for residents in Enatai and Surrey Downs and 118th Avenue SE for residents living adjacent to the Alternative B7 corridor. Those living along the Alternative B7 corridor also expressed concern for potential recreation impacts and additional impacts on wetlands from the B7 crossing of Mercer Slough. Similarly, the residents along Bellevue Way SE felt that the blueberry farm, and valuable portions of Mercer Slough and the greenbelt west of Bellevue Way SE would be compromised by the East Link Project.

In Segment C, many residents supported the project and the increase of mobility options. They specifically did not want Alternative C8E, however, which would pass in an elevated profile in front of many condominium complexes north of NE 8th Street, because they feel it would create potential noise and visual impacts.

Finally, in Segment E, comments from residents centered on Alternative E1. Several residents objected to this alternative traversing a hillside south of West Lake Sammamish Parkway, traveling below the grade of, but within view of, multiple condominium complexes. The opposition focused on the potential noise and visual impacts of this alternative. When listing their preference, Alternative E2 was widely listed.

7.4.2.2 SDEIS Residential Group Summary

There were two predominant segments where residential groups collectively organized to voice their opinions on the Supplemental Draft EIS: Segments B and C. In Segment B, the residential groups were divided among those who opposed alternatives that used Bellevue Way SE and 112th Avenue, thus preferring Alternative B7, and those who opposed Alternative B7 and supported *Preferred Alternative B2M*. The listed concerns for both groups included a potential change in their quality of life, including property acquisition and/or loss of property value, noise, vibration, safety at stations located near neighborhoods, and visual intrusion. Both groups felt that traffic would worsen on the main arterials serving their neighborhood: Bellevue Way SE for residents in Enatai and Surrey Downs and 118th Avenue SE for residents living adjacent to the Alternative B7 route. Those living along the Alternative B7 (Mercer Park and Brookshire) route also expressed concern for potential visual impacts from the Alternative B7 crossing of Mercer Slough. Similarly, the residents near Bellevue Way SE (Holly Tree Lane Homeowners Association) felt that the blueberry farm, valuable portions of Mercer Slough, and the greenbelt west of Bellevue Way SE would be compromised by the East Link Project.

In Segment C, residents of the Belle Arts Condominiums supported a tunnel profile, which they felt would minimize traffic, noise, and visual impacts in Downtown Bellevue. If *Preferred Alternative C11A* were to be chosen, they requested that the bus stop in front of their building be relocated because of the potential increase in bus traffic and noise from the reduced sidewalk width in front of their building.

7.4.3 Interest Groups

- Bellevue Community College
- Bellevue YMCA
- Building a Better Bellevue
- Cascadia Discovery Institute
- Coalition for Effective Transportation Alternatives
- Eastside Heritage Center
- Eastside Transportation Association
- Full Gospel Christian Center
- Friends of Marymoor Park
- Highland Covenant Church
- Low Income Housing Institute
- Sierra Club, Cascade Chapter
- Surrey Downs Historical Society
- Transportation Choices Coalition
- TruthInTaxation/I-90 Users Coalition
- Vision Line Coalition
- Washington Trust for Historic Preservation

7.4.3.1 Draft EIS Interest Group Summary

Eleven community organizations or interest groups submitted comments on the Draft EIS. The Vision Line Coalition is a group formed in response to the East Link Project and endorsed by 17 commercial property owners, businesses, and residents of the Cities of Bellevue and Redmond. The Coalition for Effective Transportation Alternatives (CETA) and the Eastside Transportation Association (ETA) did not support adding light rail to the Eastside, maintaining that bus rapid transit would be a more viable alternative. However, ETA did offer its preference for alternatives in Segments B and C discussed below. These organizations also questioned the technical feasibility of light rail on the floating bridge. ETA also expressed concern and the need for more information regarding potential impacts on freight movement. The I-90 Users Coalition expressed opposition to the project based on concerns regarding freight movement, subarea equity, and technical issues of retrofitting the I-90 floating bridge.

Other interest groups offered their support while expressing concerns about project-specific design considerations and additional analysis being conducted. Transportation Choices Coalition suggested conducting an analysis of joint use of the I-90 center roadway by buses and light rail. In Segment B, the Vision Line Coalition endorsed Alternative B7 and requested further study of a modified Alternative B3, as proposed by the City of Bellevue. They echoed concerns of the residential interest groups, including potential light rail impacts on traffic operations, pedestrians and traffic circulation, safety, property acquisition, and noise (on residents and wildlife), and minimizing wetland impacts. ETA expressed its preference for Alternative B7 due to less congestion, fewer neighborhood impacts, and reduced property acquisition and maintenance of future roadway capacity. Transportation Choices Coalition voiced its support for Alternative B1 for its service to dense development areas and areas in Old Bellevue anticipated for future growth.

Eastside Heritage Center, the historical organization on the Eastside and the tenant of the Winters House, does not support the removal or degradation of the Winters House, a nationally registered historic property. They asked that if the preferred route is along the east side of Bellevue Way SE, that they be consulted in the preservation and mitigation that would be required. Regarding traffic concerns in Segment B, one suggestion is to widen Bellevue Way SE before implementation of the East Link Project as mitigation to the potential traffic impacts of the project. The Cascadia Discovery Institute questioned possible freight impacts on the former BNSF Railway corridor, questioned future use impacts from stations near the hospitals, and would like to make sure that the project does not preclude the potential for a trail and the Eastside Corridor Commuter Rail project within the former BNSF Railway corridor.

Interest groups that commented on Segment C, such as Transportation Choices Coalition, the Vision Line Coalition, and the Eastside Transportation Association, expressed strong preference for the tunnel alternatives, the latter two particularly supporting Alternative C2T. Elevated alternatives were strongly rejected for their potential visual intrusion and noise impacts, except by the Sierra Club, which supported Alternative C8E. The Sierra Club also supported Alternative C4A because it would increase pedestrian accessibility. Conversely, several comments listed pedestrian safety as the reason they resisted an at-grade alternative. The Vision Line Coalition suggested additional review of the impacts of removing traffic lanes in Downtown Bellevue, the potential economic impacts of reduced on-street parking and elevated guideways on rental markets, and re-evaluation of the visual assessment for all above-grade alternatives. The Vision Line Coalition listed potential impacts on McCormick Park and relocation of medical facilities as reasons for not favoring alternatives that cross at NE 12th Street. In addition, they expressed opposition to an at-grade crossing at 116th Avenue NE, where circulation would be affected and hospital access impeded.

Comments in Segment D varied, but no interest group supported either Alternative D3 or D5. Many mentioned that Alternative D5 does not support the newly adopted Bel-Red Subarea Plan, nor does it reserve potential for future SR 520 expansion. Several expressed concern that Alternative D3 would travel along NE 20th, a heavily traveled arterial. There was generally strong support for Alternative D2A from Transportation Choices Coalition, the Sierra Club, and the Vision Line Coalition (if modified) because it would best support transit-oriented development plans. Also, some doubted that the ridership appropriately considered the future growth plans for this area of Bellevue and Redmond. Both the Full Gospel Christian Center and the Highland Covenant Church expressed opposition to Alternative D3 based on potential impacts on their facilities. Finally, the Cascadia Organization suggested building the project from east to west.

The Friends of Marymoor Park expressed support for Alternative E2, which would travel along SR 520 on Marymoor Park. They expressed concern about how proposed maintenance facility locations in Segment E may potentially impact park access. Transportation Choices Coalition also expressed support for Alternative E2 as a cost-effective alternative. The Sierra Club expressed support for Alternative E4 because it would be more direct. They also felt that either dispersing park-and-ride lots or reducing the parking lot size may influence more transit connections.

7.4.3.2 SDEIS Interest Group Summary

Comments on the SDEIS were received from 10 community organizations or interest groups. CETA did not support adding light rail to the Eastside, maintaining that bus rapid transit would be a more viable alternative. The Transportation Choices Coalition strongly advocated light rail and urged Sound Transit to avoid delays in proceeding with the project. The Coalition also supported *Preferred Alternative B2M* rather than Alternative B7, citing the need for locating light rail and transit stations in locations that would serve the highest population areas, have lower environmental impacts than Alternative B7, and lower overall cost. Other supporters of the *Preferred Alternatives* include the Bellevue YMCA and the Low Income Housing Institute.

The Vision Line Coalition commented that they feel there would be significant adverse environmental impacts that cannot be mitigated with the “B2 options” (alternatives that travel on Bellevue Way SE and 112th Avenue SE) and that the analysis of Alternative B7 is flawed. Of greatest concern with the “B2 options” are impacts on wetlands, the Winters House, noise, light and glare, traffic, and local businesses and neighborhoods. They expressed support for a tunnel in Downtown Bellevue and also feel that the potential for future expansion eastward should be discussed in the Final EIS. They also voiced support for the Building a Better Bellevue analysis, discussed below.

The Building a Better Bellevue organization, formed in response to the East Link Project, submitted a study they prepared detailing concerns they have regarding the cost estimate for Alternative B7 and suggestions for lowering the cost. This organization also recommends a formal investigation be conducted into how the Alternative B7 cost-estimate was developed because they believe it was developed in a way to inflate the costs. Lastly, they also submitted a number of questions regarding the analysis of *Preferred Alternative B2M* and questioned the need for rail banking in the former BNSF Railway corridor.

Eastside Heritage Center expressed their concerns about how the *Preferred Alternative B2M* could affect Winters House and about being relocated during light rail construction. They were concerned about loss of access to the site, increased noise and visual impacts due to construction and operation, and loss of historical character. The Center asked that if they are required to relocate during construction, that similar access and facilities be made available for their use during this time. The Washington Trust for Historic Preservation also commented on similar potential impacts on the Winters House and on the potential Surrey Downs historic district. They felt that removal of homes adjacent to those contributing to the district could result in adverse effects on the district. The Surrey Downs Historical Society believes that *Preferred Alternative B2M* and connections to Segment C along Main Street would adversely affect both the Winters House and the potential Surrey Downs historic district. They were concerned with noise, construction, and vibration impacts on both historic resources and feel that construction and operation of *Preferred*

Alternative B2M and the alternatives along Main Street would change the character and context, and diminish the value of the Surrey Downs neighborhood. They recommended selection of Alternative B7 to avoid impacts on historic resources in accordance with Section 106 of the National Historic Preservation Act and of the Section 4(f) of the Department of Transportation Act. The Surrey Downs Historical Society believes that Alternative B7 has not been sufficiently studied and requests that Sound Transit wait for the study being prepared by the City of Bellevue before an alternative is selected.

Representatives for Bellevue College (formerly Bellevue Community College) submitted multiple comments requesting transit service be provided between the college and the South Bellevue Station, and noted the large number of students and employees that commute from Seattle who would be able to use the proposed project.

7.5 Response to Common Comments

Appendix J of the Final EIS includes responses to each comment received during both the Draft EIS (Section J.1) and the SDEIS (Section J.2). Both of these sections are organized much like this summary, in order of agency, organization, residents, interest groups, and individuals. In order to provide some specific responses to common comments received, Table 7-1 is organized by the chapter and resources order as found in this Final EIS. These responses are also referenced in the individual responses to comments using the identifying code found in the left column of the table. Commenters also suggested additional alternatives to be studied.

TABLE 7-1
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
1. Purpose and Need		
CC1a	Why is bus rapid transit (BRT) or increased bus service not included as an alternative?	BRT, as an alternative for East Link, was eliminated during the Sound Transit Long-Range Planning and ST2 process. (Please see Section 1.3 in Chapter 1, Purpose and Need for East Link Project.) As stated in Chapter 1, the purpose of the East Link Project is to expand the Sound Transit Link light rail system from Seattle to Mercer Island, Bellevue, and Redmond via Interstate 90 and to provide a reliable and efficient alternative for moving people throughout the region. Light rail provides the highest level of ridership and the shortest travel times of all technologies evaluated in the corridor.
CC1b	Why do alternatives not include service to other Eastside communities such as Eastgate, Factoria, Issaquah, North Bend, Snoqualmie, Renton, Kirkland, Woodinville, and Bothell?	East Link is part of ST2, the next phase of mass transit improvements in the Puget Sound Region approved by the voters in 2008. Light rail extensions to these other locations were not included in the ST2 program. As stated in the project Purpose and Need statement, the purpose of the project is to connect Seattle to Mercer Island, Bellevue, and Redmond because this corridor has the highest ridership potential. Sound Transit's Long-Range Plan envisions potential rail extensions to Issaquah but does not envision high-capacity transit extension east beyond Redmond or Issaquah. Future extensions as part of Sound Transit's Long-Range Plan will address adding high-capacity transit service to Factoria, Eastgate, Issaquah, Kirkland, Renton, Bothell, and Woodinville. North Bend and Snoqualmie are outside Sound Transit's service area.
2. Alternatives Considered		
CC2a	Please use federal stimulus money to facilitate faster project implementation.	The 2008 stimulus package, also known as the American Recovery and Reinvestment Act, is designed to quickly inject money into the economy by using pre-existing programs, criteria, and funding methods. It is focused on job creation through funding of "shovel ready" or "ready-to-go" infrastructure projects. East Link project is in the planning stage and does not currently qualify for federal stimulus money.
CC2b	More detail for mitigation measures is needed, and mitigation should be included in cost estimates.	The EIS describes mitigation measures consistent with the current level of project design and the requirements of the environmental review process. Mitigation measures will be refined through final design and as the project goes through the permitting process. As stated in Section 2.5 of Chapter 2, Project Alternatives, the Record of Decision for East Link issued after the Final EIS would include a list of committed mitigation measures for the project to be built. Costs to implement mitigation measures were included as part of the cost estimates prepared for the EIS as described in Section 2.6.2. See also Response to Common Comment CCG3.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC2c	Cost comparisons should include the costs to the community.	The cost estimates consist of project construction costs, including property acquisition, light rail facilities, and anticipated mitigation for project impacts, as well as costs for design, permitting, and project management. Section 2.6 in Chapter 2, Alternatives Considered, provides additional information about cost methodology. Benefits and impacts to the community, such as increases to property values, travel time savings, environmental benefits of reduced pollution, inconvenience due to construction, visual, or other impacts, are discussed in the EIS but not included in the costs of the project.
CC2d	Why does the project not include an alternative across the State Route 520 floating bridge?	High-capacity transit (HCT) on SR 520 was considered during the Sound Transit Long-Range Planning and ST2 process, and the Sound Transit Board determined that I-90 is the preferred corridor for HCT across Lake Washington. The WSDOT and Sound Transit Trans-Lake Washington Study (1998-2002) analyzed options for HCT across Lake Washington and reaffirmed that I-90 was the preferred cross-lake corridor for HCT between Seattle and the Eastside for several reasons: directing Eastside riders to the UW would overcrowd the already heavily travelled corridor to Downtown Seattle; connecting to Downtown Bellevue and east to Overlake would require a circuitous route; construction would be difficult and expensive in order to connect with the University of Washington Station, which is 100 feet below grade. An alternative rail line into Downtown Seattle would be needed or riders would be required to take a forced transfer, thus decreasing travel efficiency.
CC2e	Select an alternative that does not preclude future light rail expansion.	All alternatives provide opportunities for future light rail expansion consistent with the Sound Transit Long-Range Plan. The Bellevue Way SE and the former BNSF Railway corridor project alternatives in Segment B have been designed to allow for future extensions to Issaquah with a wye junction. Kirkland and Renton are planned to be served by a potential light rail extension according to the Sound Transit Long-Range Plan. The Long-Range Plan does not envision light rail extension beyond Downtown Redmond.
CC2f	Will selection of Alternative B7 preclude use of the former BNSF Railway corridor for commuter rail?	Alternative B7 would not preclude use of the corridor for commuter rail. Alternative B7 has been designed to accommodate a planned trail by King County (or a reactivated freight/commuter rail service) in most places. Some of the areas are narrow and would require small right-of-way acquisitions. Please refer to Appendix G1, which illustrates the location of light rail with the corridor for trail/utilities/rail uses, along with a representative cross section.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC2g	The following B7 Route elements presented in Sound Transit's DEIS and SDEIS reports raise significant questions as to their necessity and/or sufficiency of analysis: 1. A Redundant and Costly New Bike and Walking Trail 2. A Wide Project Footprint With Questionable Rail Line Placement 3. An Excessively Large Park and Ride Facility Placed Near Sensitive Areas, Requiring the Taking of Expensive Private Property 4. Bridge Structure Across the Slough Constructed Using Costly Methods 5. Failure to Utilize Unused Roadside Right of Way Along the West Side of I-405, Requiring the Taking of Expensive Commercial Property 6. Environmental Risks Overstated	1. If Sound Transit uses the former BNSF Railway corridor for light rail, it must accommodate a trail and the possible return of freight. The Alternative B7 design accommodates a bicycle/pedestrian trail because of contractual responsibilities to the Port of Seattle (the corridor owner) and King County (the trail sponsor and trail easement owner). There are also limitations on the use of "railbanked" freight rail corridors. 2. The Woodinville Subdivision (part of the former BNSF Railway corridor used in the B7 alignment) is railbanked in accordance with the National Trails System Act of 1983 (NTSA) (16 U.S.C. 1247 (d)). Sound Transit's design of the Alternative B7 alignment will accommodate a freight track. The space necessary to accommodate a freight track is also enough to accommodate a multi-use trail. The B7 corridor footprint in the Sound Transit early design options (about 5 percent engineering) is largely dictated by the need to protect the railbanked status of the corridor. 3. The 118th Station is located at the proposed site because there was not adequate room at the existing Wilburton Park-and-Ride Lot for a station and the route would travel through these commercial properties and displace some of these businesses without the station. The station location would allow the station and parking garage to be constructed in an already developed area that would avoid impacts on sensitive areas. 4. The Final EIS describes that construction of the elevated light rail could take place from a temporary work trestle, which is a conventional method of construction for sites over water, over structurally weak soils, or in environmentally sensitive areas. Generally, a work trestle consists of short spans of steel and/or timber stringers and deck, supported by timber or steel piling. The trestle is used to support cranes or excavation equipment, and provide a haul route for construction materials and spoils while protecting the terrain below. The proposed construction method is a reasonable assumption at this stage of design. While the cost of the temporary work trestle is significant, any alternative method would also have cost associated with building in poor soils and over water. 5. Sound Transit's Alternative B7 alignment accommodates WSDOT's I-405 Master Plan for expanding I-405. Those plans call for highway expansion primarily to the west of the existing I-405, not to the east as stated in the Build a Better Bellevue report. 6. Peer reviews of Sound Transit work commissioned by the City of Bellevue found that environmental impacts are not overstated for Alternative B7. The peer reviews found: "Sound Transit's East Link Draft EIS fairly compares the B7 alignment with other Segment B alternatives. The technical approach and methodologies used to evaluate the environmental impacts of B7 are generally consistent with professional standards in the various disciplines" (David Evans Assoc, 2010).
3. Transportation		
CC3a	The no-build analysis should include the I-405 Bus Rapid Transit (BRT) plans.	WSDOT has published a programmatic Final EIS for the I-405 Master Plan. Within this document WSDOT identified bus rapid transit (BRT) as a component to the I-405 Master Plan, but has not conducted a specific environmental assessment of implementing an I-405 BRT system. As such, the implementation schedule and funding for this BRT system is not known at this time and the East Link EIS has not assumed BRT on I-405 as part of the No Build analysis. This complies with environmental regulations that only likely foreseeable planned and programmed projects are assumed in the no build condition.
CC3b	Will communities near stations experience hide-and-ride parking due to the lack of park and ride facilities or overcapacity park and ride facilities?	The potential for hide-and-ride parking at light rail stations and park-and-rides is expected to be low, as described in Section 3.6.3 of Chapter 3, Transportation Environment and Consequences. There is limited available on-street parking surrounding most of the proposed stations, and parking surrounding the proposed stations is often restricted by the local jurisdictions. It is expected that people not able to park at a park-and-ride station will either use another station that has available parking or over time, change their mode of travel to reach the station. Sound Transit would work with the local jurisdictions to limit on-street parking, if appropriate, and reduce the potential for hide-and-ride occurrences.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC3c	Will the East Link Project create more roadway congestion, especially near stations, and is more traffic mitigation needed to reduce this congestion?	The East Link project would reduce vehicle miles travelled (VMT) and vehicles hours travelled (VHT) in the region as described in Section 3.3.3 of Chapter 3 because greater than 10,000 new transit riders would use the light rail system every day with the project. The traffic operation analysis is described in Section 3.6.3 of the Final EIS. In general, the analysis predicted that, for light rail along at-grade profiles or elevated within the roadway right-of-way, intersections would generally operate at a level of service (LOS) similar to that of the No Build Alternative, although a few intersections in the study area may degrade depending on the alternative and intersection movements. This is partly because a similar roadway capacity is provided in most cases with East Link, but also because light rail trains are generally able to safely travel through intersections without substantial signal timing adjustments. For alternatives with either elevated or tunneled sections, intersections in general are expected to operate similar to the No Build because these profiles are generally outside the roadway right-of-way. Intersections near potential stations are expected to operate in most cases at an LOS similar to No Build, although intersections immediately adjacent to stations with park-and-ride facilities may operate worse than No Build. Where impacts are identified, which consists of intersections that degrade below the LOS standards of the jurisdiction due to East Link, improvements to mitigate the impact are proposed and described in Section 3.6.5 of the Final EIS.
CC3d	Bellevue Way is already congested and the South Bellevue Station will increase that congestion.	Traffic operations along Bellevue Way SE are discussed in Section 3.6 of Chapter 3, Transportation Environment and Consequences, which has been updated for the Final EIS. Two roadway modification options are proposed to improve the station and neighborhood access along Bellevue Way SE near the South Bellevue Station. The first option would install traffic signals along Bellevue Way SE at the south driveway to the South Bellevue Station and at SE 30th Street and convert the center two-way left-turn lane from the South Bellevue Station to I-90 into a southbound HOV lane. Some turn restrictions are included with this option and are described in Section 3.6.3 in the Final EIS. The second option would install a traffic signal at Bellevue Way SE and the south driveway to the South Bellevue Station. With this signal, northbound U-turn movements would be allowed at this intersection. No changes to property access and circulation along Bellevue Way SE would occur south of the south driveway in this option. With either of these two options, traffic congestion along Bellevue Way SE would be similar between the No Build and build alternatives that include a South Bellevue Station.
CC3e	118th Avenue SE will be too congested with the 118th Station.	Additional intersections along 118th Avenue SE have been included in the Final EIS traffic operations analysis to document associated impacts. This information is provided in Section 3.6 of the Final EIS. With the 118th Station (Alternative B7), two intersections along 118th Avenue SE and Coal Creek Parkway would be affected, but both of these intersections can be mitigated.
CC3f	The ridership estimates for Alternative B7 seem low.	Appendix A (Attachment 3) of Appendix H1, Transportation Technical Report, provides a general overview of how the Sound Transit Ridership model produces ridership forecasts. Among the many factors that the model takes into account to produce transit ridership are the adopted Puget Sound Regional Council (PSRC) land uses, population density, parking costs, transit fares, household income, and highway travel time for various modes. Also included are observed transit travel patterns such as passenger origin and destination, and transit service characteristics such as bus access, frequency, and hours of service. As input into the model, Sound Transit and King County Metro service planners developed an integrated rail/bus services plan for 2020 and 2030. The work identified the appropriate and likely bus service for Alternative B7 and specifically at the 118th Station. The service planners determined that bus service for the areas east (along I-90) and south use I-90 to enter Seattle and are not likely to be rerouted north to the 118th Station because of the out-of-direction travel and impacts on the bus reliability that would be created by traveling north along I-405 and having to turn back and continue their route. Similarly, the model predicts that people driving from the communities to the east and south of South Bellevue and heading into Seattle are not as likely to use the 118th Station and instead would shift travel patterns to the surrounding stations such as the Mercer Island Station in Segment A, which is a direct connection along their route and anticipated to have higher daily boardings if Alternative B7 is selected. Results from the ridership model estimate that Alternative B7 is expected to have projectwide ridership lower than other Segment B alternatives. By 2030, projectwide ridership would range from a daily low of 46,000 with Alternative C14E connected to B7 to a daily high of 52,500 for Alternative B1 connecting to C1 or C3T. Daily ridership differences can be considered substantial if the forecast variation among alternatives for projectwide East Link ridership exceeds about 2,000 daily boardings.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC3h	The ridership estimates and traffic impact analysis should include the land uses adopted in the City of Bellevue's Bel-Red Subarea Plan and the City of Redmond's Overlake Master Plan.	The Puget Sound Regional Council travel demand and Sound Transit ridership models used in the East Link Project Draft EIS to forecast the future travel and ridership information did not reflect the City of Bellevue's Bel-Red Subarea Plan and the City of Redmond's Overlake Master Plan because they were not adopted prior to publication. With the recent adoption of these plans, the ridership and traffic impact analysis in this Final EIS has been updated to reflect these plans and associated adopted transportation projects. Refer to Appendix A of Appendix H1, Transportation Technical Report, for the list of transportation projects included in the No Build Alternative from these two adopted plans.
CC3i	What are the impacts of construction on traffic?	An updated and more refined assessment of the construction period is discussed in Section 3.6 of Chapter 3, Transportation Environment and Consequences. The methodology for this construction analysis is located in Appendix A in Appendix H1, Transportation Technical Report. As part of this assessment, the number of construction vehicles and potential haul routes are provided based on the level of information known at this time. In addition, potential roadway lane closures and their impacts on traffic operations, parking impacts, transit service disruptions, neighborhood cut-through traffic, and detour route opportunities are also described in this Final EIS by alternative. In general, most alternatives limit construction impacts to one side of the road because the project is outside the roadway right-of-way. When alternatives are within the roadway right-of-way or require cut-and-cover tunneling activities, traffic impacts are expected to be more noticeable. There would be intermittent road or lane closures and detour routes would be needed. Business and property accesses would be maintained to the extent possible either in their current locations or through nearby accesses.
CC3j	How will at-grade alternatives affect access (driveway closures, loss of turn movements, safety, increased congestion) to adjacent properties, such as along Alternative C4?	To provide quality service, at-grade train operations require a safe environment for vehicles and pedestrians to cross the light rail tracks. Therefore, when the light rail track is located within a roadway, driveway access will be modified to only allow turns at protected locations (where a traffic signal or gate or another appropriate type of signal can be provided) across the light rail tracks. This will change some full access driveways to only allow right-in, right-out movements. U-turns are proposed at the nearest practical signalized intersection to continue providing convenient access to and from these properties. Where a driveway is closed, alternative access will be provided, if not already available, to the property. This information is provided in the conceptual drawings provided in Appendix G1. In each case, change in trip patterns and vehicle circulation has been accounted for in the transportation analysis. Appendix E in Appendix H1, Transportation Technical Report, provides a summary of the relevant national studies conducted on light rail safety for various track alignments. The traffic operations under the various at-grade alternatives are described in Section 3.6.3 in Chapter 3, Transportation Environment and Consequences. In general, at-grade alternatives in Downtown Bellevue are not expected to substantially affect the overall downtown street operations, but there would be impacts on intersections along and nearby the alternative. Where impacts are identified, roadway improvements are proposed as mitigation. Where roadway improvements are not feasible, operational traffic management would be proposed at these locations in lieu of roadway capacity improvements. To further support these conclusions, a review of the potential at-grade light rail operations in Downtown Bellevue was conducted by a panel of traffic engineering and transit operations professionals from Portland, Denver, and San Diego. Based on their extensive experience in all three cities, the panel concluded that the at-grade surface alternatives included in the Final EIS would have impacts on traffic operations that are similar to the impacts of other surface light rail systems in the comparable environments of Downtown Portland, Downtown Denver, and Downtown San Diego. The panel noted that most of the changes in forecast future traffic operating conditions in Downtown Bellevue are the result of traffic volume growth and not the introduction of surface light rail. Section 3.7 in Chapter 3 of the Final EIS and Section 7 in Appendix H1 describe the pedestrian circulation and safety with the East Link Project. Potential pedestrian treatments that have been incorporated into other at-grade light rail systems across the U.S. include additional signage, crosswalks and lighting, unique pedestrian signals and gates, sidewalk railings, painted crosswalks, audible alerts, and uniquely textured pavement. These types of treatments are potential design features that could be included, if appropriate, as elements in the design of the selected alternative.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC3k	How will bus service be changed with the East Link project?	As described in Section 3.4 of Chapter 3,Transportation Environment and Consequences and detailed in Section 4.3 of Appendix H1, Transportation Technical Report, as part of the East Link Project, King County Metro and Sound Transit service planners developed a projected rail/bus service for the project. A discussion is included in Chapter 3. Metro and Sound Transit routes would be refined to develop an integrated transit network with transit hubs at many East Link stations. Some routes would be eliminated where bus service duplicates light rail service and other routes would be modified to end and begin at light rail stations.
CC3l	What are the impacts of the East Link project to bus travel on I-90?	Funding to complete the I-90 Two-Way Transit and HOV project is included in the ST2 package approved by voters in November 2008. This project will complete the I-90 HOV lanes to Seattle on both westbound and eastbound directions prior to the East Link construction on I-90. As discussed in Section 3.5.3 of Chapter 3, Transportation Environment and Consequences, with the addition of these outer roadway HOV lanes and joint rail-bus use of the D2 Roadway, the East Link Project shows up to a 3 minute improvement in the reverse-peak direction and up to a 3 minute impact in the peak direction on bus transit travel time across I-90 compared with the No Build Alternative. If use of the D2 Roadway is not designated as joint use for bus and light rail, bus travel times across I-90 would increase by up to 4 minutes in year 2030 during the PM peak hour as buses are rerouted to other roadways to access Downtown Seattle. Potential mitigation for bus service without joint use in the D2 Roadway is described in Section 3.4.5 of Chapter 3 and would be further examined during the design phase of this project, including transit signal priority on 4th Avenue.
CC3m	How will East Link construction impact transit service and transit facilities such as park and rides?	Existing transit service routes would continue with revisions to serve transit stations and potentially relocated park-and-ride parking. For more information, construction impacts and mitigation of impacts to transit service and park-and-rides is discussed in Sections 3.4.4 and 3.4.5 of Chapter 3, Transportation Environment and Consequences. Additional coordination with King County Metro and Sound Transit Regional Express service will occur as detailed construction plans regarding transit service are developed during the final design and permitting phase of the East Link project.
CC3n	Can the I-90 floating bridge structure support the light rail?	*Preferred Alternative A1* has several design considerations regarding the compatibility of light rail with the I-90 floating bridge, Alternatives Considered. The Washington State Legislature Joint Transportation Committee commissioned an independent review team (IRT) to evaluate the bridge design with light rail. The IRT concluded that all issues identified as potentially affecting feasibility can be addressed. See Section 2.3.2 of Chapter 2 for further information.
CC3o	What is the traffic and freight impact of use of the I-90 center lanes for light rail?	The East Link Project would require dedication of the I-90 center roadway for high-capacity transit, as stipulated in the 1976 Memorandum Agreement (as amended in 2004) by Seattle, Mercer Island, Bellevue, King County Metro, WSDOT, and Sound Transit. HOV lanes are being built on the outer roadways in a three-stage project known as the I-90 Two-Way Transit and HOV Project, allowing HOVs to travel in both directions any time of the day. The entire I-90 Two-Way Transit and HOV Project would need to be constructed prior to the East Link Project so that HOV traffic can be moved from the center roadway to the outer roadways. When compared to the No Build Alternative, travel times across I-90 for vehicles and trucks would improve or remain similar with East Link as the transit mode share (or percentage of people using transit) would increase on I-90 with light rail. Although congestion would still occur on I-90 with the East Link Project, it would be shorter in duration and affect a smaller area as people shift to use light rail. Light rail would not only provide an increase in transit use but also allow more people to cross Lake Washington on I-90. Compared with the No Build Alternative, East Link would increase the number of people able to travel across I-90 without adding lanes. I-90 travel time and throughput information is provided in greater detail in Section 3.5.3 of Chapter 3, Transportation Environment and Consequences. The East Link Project has the capacity to comfortably carry 600 persons per 4-car train and 800 persons with crowded conditions. Therefore, with the project, the center roadway would have a peak-hour capacity of up to 18,000 to 24,000 people per hour, equivalent to between 6 to 10 freeway lanes of traffic.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC3p	What is the traffic and bus service impact of removing the HOV direct access ramps between I-90 and Bellevue Way?	Segment B alternatives would exit I-90 either at-grade on existing HOV ramps to/from Bellevue Way or elevated over the westbound I-90 lanes. Alternative B1 would require removal of the eastbound HOV off-ramp and the westbound HOV on-ramp. The remaining Segment B alternatives would have an elevated connection across westbound I-90, allowing the preservation of HOV direct access to westbound I-90, but would have the option to either close or keep open the eastbound HOV off-ramp from I-90 to Bellevue Way SE. Keeping the ramp open would require reconstructing the ramp and making other interchange modifications. WSDOT has indicated it will require both ramps to remain for HOV use. With the option to remove the eastbound direct-access HOV off-ramp to Bellevue Way, Alternatives B2A, B2E, B3, and B7 would not affect HOV travel times to Bellevue Way because of the low level of congestion between Mercer Island and the Bellevue Way interchange. Alternative B1 would remove the westbound direct-access HOV on-ramp from Bellevue Way SE, which would increase travel times for westbound HOV users by 10 to 12 minutes. With any of these Bellevue Way HOV direct-access options, the general purpose traffic on I-90 would not be affected. The potential closure of the HOV direct-access ramps would not affect bus service because buses currently using these ramps are planned to be eliminated with the project, except for with Alternative B7. With this alternative, one transit route would be rerouted to the general-purpose ramp if the eastbound HOV direct-access off-ramp is closed.
CC3q	Alternatives along Bellevue Way will increase traffic on 108th Avenue SE and create an unsafe walk route for Enatai Elementary.	There is not an expectation of a substantial increase in traffic on 108th Avenue SE along the walk route for Enatai Elementary with the project. Please see Section 3.6 for the traffic analysis and neighborhood impacts in Segment B.
CC3r	How will tolling on SR 520 affect traffic on I-90 with the project?	Tolling on SR 520 is assumed to occur in all future year conditions and has been incorporated into the Transportation analysis. Please see Section 3.5 in Chapter 3 for information on SR 520 and I-90 conditions.
Chapter 4 – Affected Environment and Environmental Consequences		
4.1 Acquisitions, Displacements, and Relocations		
CC4.1a	Under one or more alternatives, I will be displaced from my home or business. How will residents and businesses be relocated?	As described in Section 4.1, Acquisitions, Displacements, and Relocations, Sound Transit would comply with appropriate provisions of the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act and the State of Washington's relocation and property acquisition regulations. Property owners whose entire or partial property would be acquired by Sound Transit would receive just compensation for their land and improvements. Just compensation is an amount paid to a property owner for property acquired for public purposes that is not less than the fair market value of the property acquired including damages or benefits to the remaining property. Compensation would include any measurable loss in value to the remaining property as a result of a partial acquisition. Permanent parking lost from partial acquisition would be mitigated through compensation to the property owner or provision of replacement parking. Sound Transit's relocation assistance and advisory services would include, but not be limited to, measures, facilities, or services that may be necessary or appropriate to determine the relocation needs and preferences of each household, business, and nonprofit organization to be displaced. Sound Transit would provide current information on the availability, purchase prices, and rental costs of comparable replacement dwellings. Other benefits and compensation may include payment of residential moving expenses and replacement housing payments, nonresidential moving expenses, and reestablishment expenses. Sound Transit's Business and Residential Acquisition and Relocation handbooks outline compensation and acquisition procedures in detail. Sound Transit is committed to working closely and proactively with residents and businesses to help them plan ahead for relocation, find new homes or sites, and solve problems as they may occur. While relocation assistance would mitigate the displacement, relocation could still represent an inconvenience or hardship to some property owners. Sound Transit has adjusted alternatives during conceptual design to avoid or minimize impacts, including property acquisitions, to the extent possible. This alternative refinement process will continue throughout final design.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC4.1b	Displacement of the Commons Medical Building would be a hardship to a large number of businesses and the patients they serve.	In accordance with a Sound Transit Board motion, the Final EIS includes a revised design for Alternatives C3T and C4A that shifts the Ashwood/Hospital Station to the east and avoids the need to use this property as staging. However, Alternatives C7E and C8E would affect this property.
4.2 Land Use		
CC4.2a	How will the proposed transit oriented development legislation, House Bill 1490, affect land use around light rail stations?	The legislation for transit-oriented development (House Bill 1490) did not advance. The bill was opposed by the City of Seattle and other cities based on their interest in preserving local control in zoning and development. The Cities of Seattle, Mercer Island, Bellevue, and Redmond control zoning and development within their jurisdictions. Refer to Section 4.2, Land Use, for information on transit-oriented development associated with East Link alternatives.
CC4.2b	The City of Bellevue should uphold its 1981 commitment to protect the residential neighborhoods from downtown development.	The City of Bellevue controls zoning and development. The project would not result in any changes to how the land is zoned or uses allowed. The East Link alternatives within Downtown Bellevue are located along existing arterials, which would minimize impacts on residential neighborhoods. The project would continue to support that growth be focused in Downtown Bellevue and encourage the use of public transportation as well acts as a catalyst for growth in those areas, including the Bel-Red Subarea where higher densities are encouraged and the land uses have recently been rezoned to support a mix of uses. Refer to Section 4.2, Land Use, for information on existing zoning and how land uses would be affected as a result of the project.
CC4.2c	The Draft EIS does not address all of the relevant goals and polices from the Bellevue Comprehensive Plan.	The plans and policies identified in the comments have been reviewed, and Section 4.2, Land Use, and Appendix F4.2, Land Use Plans, Goals, and Policies, have been updated and expanded as appropriate based upon the relevance of the goals and policies to the project. The discussion in Appendix F4.2 has also been updated to identify the consistency of certain alternatives with the goals and policies. Some of the identified policies are not relevant to the East Link Project and therefore have not been included. East Link is generally consistent with the City's policies and goals.
CC4.2d	Information from the City of Bellevue's Light Rail Best Practices Report should be included in the EIS, and the project should be consistent with the recommendations in the report.	Section 4.2, Land Use, in Chapter 4, and Appendix F4.2, Land Use Plans, Goals, and Policies, have been updated to include information on the Light Rail Best Practices Report. The cross-referenced goals and policies from the City of Bellevue Comprehensive Plan have been reviewed and those applicable have added to Appendix F4.2. Measures include the use of context-sensitive design, use of public art, and public involvement.
4.3 Economics		
CC4.3a	Will the East Link project lower property values due to a nearby station or light rail corridor that generates noise, vibration, and visual impacts.	Section 4.3, Economics, discusses potential positive and negative economic impacts, including property value impacts, of the proposed project. Studies indicate that residential and commercial property values near light rail transit stations typically increase and are valued higher than similar properties not in the vicinity of transit stations. This impact is likely to occur in all segments of East Link, but the benefits may be most realized in Segment D, where both Bellevue and Redmond have adopted supportive plans for transit-oriented development. Studies have also found that property value impacts from light-rail transit can be negative, particularly along a light rail route not in the vicinity of a station. These negative impacts to property values are most likely to occur when the light rail project results in noise or visual impacts noticeably greater than what currently exists and are more often associated with elevated, and to a lesser degree, at-grade alternatives. Sections 4.5, Visual and Aesthetic Resources, and Section 4.7, Noise and Vibration, suggest that there is relatively little potential for these impacts to be of a sufficient magnitude after mitigation to result in negative property value impacts.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC4.3b	Project construction and operation will create too many impacts to businesses.	Project construction requires the acquisition and relocation of a number of businesses. Section 4.3, Economics, provides information on the property acquisition impacts on businesses. Relocation assistance would be provided to businesses as appropriate. It is anticipated that many of the jobs at these businesses would be relocated and not lost. Industrial-related businesses that need to relocate and are located in Segment D, within Bellevue, would be impacted because of the changing land use and zoning in the area that would no longer support industrial-related use. These businesses might need to relocate outside of Bellevue. Refer to Section 4.2, Land Use, for additional information on the changing land use and zoning in Bellevue. The project would displace some off-street parking and reduce the ability to make some left-hand turns in some locations as described in Section 4.3.3. This could result in impacts on adjacent businesses; however, the extent is expected to be minimal and in some situations would be offset by the improved visibility of businesses for transit riders. Operation may also result in positive business impacts related to transit-oriented development in those areas where growth and higher densities are encouraged, including Downtown Bellevue and the Bel-Red corridor. Light rail can act as a catalyst for transit-oriented development. Sections 4.3.3 and Section 4.2.3 provide additional information on the positive benefits for businesses. During construction, business impacts could include noise, vibration, dust, loss of parking, and traffic congestion in the areas of construction activities. Depending on the location of the construction activities and nature of the activities, the impacts on businesses would vary. Business-related impacts are more likely to occur near surface construction activities. Businesses that tend to rely on drive-by traffic to attract customers would experience the greatest impacts. Section 4.3.3 provides information on the economic impacts associated with construction in each project segment. As described in Section 4.3.4, a number of mitigation measures have been identified that would minimize the impacts on businesses during construction, including a 24-hour construction telephone hotline, signage, business cleaning services on a case-by-case basis, promotion and marketing measures to help affected businesses, maintaining access as much as possible, and providing a community ombudsman. In addition, other sections of the Final EIS identify mitigation measures related to noise (Section 4.7), dust (Section 4.6), acquisitions (Section 4.1), and traffic (Chapter 3).
4.4 Social Impacts, Community Facilities, and Neighborhoods		
CC4.4a	The project results in impacts on the neighborhoods in Bellevue.	None of the alternatives would result in significant impacts on neighborhood quality, social interaction, community resources, or safety and security, as identified in Section 4.4, Social Impacts, Community Facilities, and Neighborhoods. The project does not bisect any neighborhoods as it travels along or adjacent to existing transportation corridors. While some residences would have visual impacts resulting from vegetation removal or the presence of the light rail structures, and/or changes in access, especially those alternatives which are at-grade, these impacts would only affect residences adjacent to the project elements and not affect the overall neighborhood quality or social interaction. The project would require property acquisitions on the border of some neighborhoods, but these acquisitions would not affect the overall neighborhood cohesiveness. After mitigation, impacts on the neighborhoods are expected to be minimal. Refer to Section 4.4 for complete information on what impact the project would have on the neighborhoods. During construction, neighborhoods could experience impacts related to noise, dust, and traffic congestion. Depending on the location of construction activities, impacts on the neighborhoods would vary, as would the amount of time. Measures would be implemented to address the impacts and are identified and referenced in Section 4.4. Refer to Section 2.4 in Chapter 2, Alternatives Considered, for information on construction approach for the alternatives.
CC4.4b	Alternative B7 would be located very close to residents, and the proximity of the proposed light rail to these residences is closer than that identified in the Draft EIS due to the recent I-405 project, which will increase noise impacts.	Alternative B7 would be located in an exclusive right-of-way in portions of the former BNSF Railway corridor. The Final EIS analysis reflects changes to the former BNSF right-of-way and adjustments made during the construction of the I-405 widening project. The design change is a result of a new sound wall constructed as part of the WSDOT I-405 project. The existing sound wall would be extended to the north and south to mitigate for noise impacts associated with the East Link Project.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC4.4c	Alternatives B2A, B2E, and B3 will impact the Bellevue Club.	After construction has been completed, the function of the Bellevue Club would not be compromised from these alternatives, as discussed in Section 4.4, Social Impacts, Community Facilities, and Neighborhoods. The analysis in Sections 4.5, Visual and Aesthetic Resources, and 4.7, Noise and Vibration, respectively, indicate that the 112th Avenue corridor's visual quality would not be adversely lowered and noise and vibration impacts could be successfully mitigated. The elevated alternatives would prevent automobile conflicts with the train movements in and around the club vicinity and would also minimize the amount of right-of-way required to operate the project. Access to the club would be maintained, and all activities at the club are expected to continue during construction, although there may be some short-term inconveniences. During construction there would be temporary impacts related to noise, dust, and traffic congestion, as described in Section 4.4. For additional information on the construction approach, refer to Section 2.4 in Chapter 2, Alternatives Considered. Construction of Alternative B3 would require the loss of some parking stalls in the back of the parking lot for the elevated structure support piers. Sound Transit would provide fair and just compensation for any use of property.
4.5 Visual and Aesthetic Resources		
CC4.5a	The elevated structures will cause greater visual impacts.	Sections 4.5, Visual and Aesthetic Resources, identifies elevated structures as some of the most visible project components. Elevated light rail structures associated with some of the alternatives would be seen to varying degrees and existing views would change from some nearby residences. To minimize visual impacts, elevated structures are used only where necessary for grade-separation and are designed with the lowest height practical, or as allowed by required vertical clearances. The development of the project includes aesthetic treatments that are outlined in Section 4.5. Specific potential mitigation measures for visual impacts are outlined in Section 4.5.4.
CC4.5b	More detail for landscaping mitigation such as planting size is needed.	Potential mitigation measures for visual impacts are discussed in Section 4.5.4 of Section 4.5, Visual and Aesthetic Resources. In addition, Section 4.5.3 lists impact minimization efforts (such as planting appropriate vegetation within and adjoining the project right-of-way to mitigate for existing street trees and other visually important vegetation removed for the project and/or to provide screening for sensitive visual environments and/or sensitive viewers) that would be part of the project. The specific details of replacement landscaping will be developed during final design and permitting process.
CC4.5c	The visual quality analysis of existing conditions and potential impacts analyses are not consistent with my evaluation of the existing conditions and project impacts, and additional detail is needed.	The methodology as described in Appendix F4.5, Visual Consistency and Key Observation Point Analyses, is used in varying degrees throughout the transportation profession in order to assess project impacts. While there are many interpretations of how to define visual quality, this process tries to offer objective criteria that can be applied universally. This process, based on the Federal Highway Administration (FHWA) Visual Impact Assessment for Highway Projects, has been employed for the past 30 years. Consistent with the FHWA manual, visual quality was categorized for portions of segments that exemplify common landscape categories and not on a property-by-property basis. The methodology evaluated how the project would change existing conditions in terms of vividness, intactness, and unity. Please see Appendix 4.5 for more detail. The methodology used is appropriate for a project of this scope and for identifying differences in visual impacts between a large number of alternatives. Each component of the visual assessment (vividness, intactness, and unity) was assessed as high, medium, or low and then averaged for the overall visual quality rating.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
4.7 Noise and Vibration		
CC4.7a	What are the noise impacts during construction and operation of East Link light rail?	The noise impacts of the project are described in Section 4.7, Noise and Vibration, and Appendix H2, Noise and Vibration Technical Report. Sound Transit has calibrated noise impacts with actual noise as measured from the Central Link light rail, train operation noise measurements, identification of track crossovers, and at-grade crossings where bells would ring. The methodology for impact analysis is from the Transit Noise and Vibration Impact Assessment Manual (Federal Transit Administration [FTA], revised May 2006). These criteria are used for all federally funded high-capacity transit projects. Sound Transit has many options of providing mitigation, and all noise impacts can be mitigated to within the FTA noise criteria during the operations of the light rail system. The Final EIS noise and analysis includes the most current measured data. Construction noise would be required to meet the noise regulations of local jurisdictions. As described in Section 4.7, Sound Transit would, as practical, limit construction activities that produce the highest noise levels to daytime hours, or when disturbance to sensitive receptors would be minimized. This section also includes a list of potential noise control measures that would be used either individually or in combination to meet the noise limits. If any nighttime construction was planned, Sound Transit would be required to obtain a noise variance from the City. As stated in Section 2.5 of Chapter 2, Project Alternatives, Sound Transit is committed to satisfying all applicable environmental regulations and to responsibly and reasonably mitigate significant adverse environmental project impacts consistent with Sound Transit policies and applicable regulations. Mitigation measures will be refined through final design and permitting.
CC4.7b	The SDEIS states that "even with the recommended noise mitigation measures, there is potential for residual exterior noise impacts"… How will these exterior noise impacts be mitigated?	As described in Section 4.7.4 of the Final EIS, Sound Transit would provide mitigation for operational noise impacts above the Federal Transit Administration (FTA) criteria consistent with the agency's Noise Mitigation Policy (ST Board Motion 2004-08). This policy establishes a preference for source control (e.g., special trackwork; rail lubricators) or path barrier (such as sound walls between the guideway and the receiver property) methods to mitigate light rail noise. When these methods are infeasible or not effective at reducing noise levels below FTA impact criteria, then residential sound insulation would be evaluated and implemented at impacted properties where the existing building does not already achieve a sufficient exterior to interior reduction of noise levels. In these cases, some exterior uses might experience noise levels above the FTA impact criteria. Sound Transit does not consider these to be a significant adverse impact warranting further mitigation for the following reasons: 1. Consistent with FTA methods and criteria, residential properties are considered "noise-sensitive" primarily because people sleep there and "nighttime sensitivity to noise is assumed to be of utmost importance" (FTA, 2006). Accordingly, FTA methods artificially increase measured existing noise and predicted project noise levels by 10 dBA (a doubling of the noise level) between 10:00 p.m. and 7:00 a.m. While noise measurements and impacts are predicted for outside noise levels at residential properties, FTA methods clearly emphasize noise sensitivity for residential properties at night because project noise could affect people's ability to sleep. 2. During the day and peak traffic periods, light rail noise levels are very similar to (in some cases less than) common noise levels in an urban setting like Downtown Bellevue or along transportation corridors (like I-90, Bellevue Way, 112th Avenue, I-405) where the predominant noise is from existing traffic (buses, trucks, and heavy traffic volumes). During these times of the day, when outdoor uses are most frequent, noise from the light rail would typically be less noticeable because of the higher ambient noise levels from traffic and other urban sources.
4.8 Ecosystem Resources		
CC4.8a	Does Sound Transit have a policy about tree protection?	Section 4.8, Ecosystem Resources, describes impacts on natural resources, including high-value habitats with trees such as riparian forest, urban mostly vegetated forest (coniferous forest, deciduous forest, mixed coniferous/deciduous forest), and urban mostly vegetated areas. High-value habitats regulated by local agencies that would be affected by the project would be mitigated with habitat replacement or enhancement. While Sound Transit would protect mature/established trees to the extent practical, trees and vegetation would need to be cleared for the project to be built and trees might interfere with the overhead catenary power system. Therefore, a clearance zone of 20 feet from the outside tracks is maintained adjacent to the light rail system. Mitigation measures would include restoration of the disturbed area with the appropriate landscaping.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC4.8b	Segment B alternatives and the South Bellevue Station impact the Mercer Slough wetlands.	All Segment B alternatives would have varying degrees of operational and construction impacts on the Mercer Slough wetlands and/or wetland buffers, as discussed in Section 4.8, Ecosystem Resources. While *Preferred Alternative B2M* would affect the greatest amount of wetland buffers, Alternative B7 would result in the greatest loss of wetland and high-value habitat acreage and the least loss of wetland buffer acreage for construction and operation. The other Segment B alternatives would result in a smaller loss of wetland and high-value habitat acreage compared to both *B2M* and B7 and a smaller loss of wetland buffer acreage during construction and operation compared to *B2M*. Section 4.8 describes potential mitigation measures for these impacts.
4.11 Geology and Soils		
CC4.11a	The soils in Mercer Slough are not suitable for construction of the light rail station and parking garage structure.	Since the Draft EIS and SDEIS were issued, Sound Transit has conducted approximately 10 explorations involving drilling, sampling, and testing of subsurface soils at the South Bellevue Park-and-Ride Lot. Results of these explorations revealed that overall conditions within the park-and-ride comprise competent sands and gravel, which are suitable for construction. These explorations identified a limited area along the northeastern side of the park-and -ride that includes a localized pocket of up to 25 feet of softer soil deposits within the footprint of the proposed parking garage. These softer deposits include peat and clays, which in general would not be suitable for construction of the parking garage. Therefore, methods have been identified to address these conditions. The proposed approach involves of the use of drilled shaft foundations to support the garage and possibly the use of ground improvement in localized areas elsewhere. The areas of poor soils are relatively limited, and therefore, the approach being suggested is feasible.
CC4.11b	Alternative E1 will impact the steep slopes along the west side of West Lake Sammamish Parkway.	Geologic risks and impacts of erosion and slope failure are discussed in Section 4.11, Geology and Soils, which identifies the steep slopes along the west side of West Lake Sammamish Parkway. The EIS lists best management practices (BMPs) to help minimize erosion hazards including: • Maintaining vegetative growth and providing adequate surface water runoff systems • Constructing silt fences downslope of all exposed soil and using plastic covers over exposed earth • Using temporary erosion control blankets and mulching to minimize erosion prior to vegetation establishment • Limiting amounts of exposed earth during construction in wet winter months During final design, detailed slope stability evaluations would be conducted, and where appropriate, methods of stabilization developed. Methods that could help minimize landslide hazards include, but are not limited to, the following: • Use of retaining structures that are designed for the loads from moving soils • Use of mechanical slope reinforcement such as ground anchors and micro-pile system • Construction specifications and quality assurance programs that prohibit over-steepened slopes • Groundwater and surface water control In addition, a detailed study during final design would confirm the degree of geologic risk such as might occur from erosion and slope failure. At sites where geologic conditions are not suitable, appropriate engineering design studies, construction measures, and BMPs would be used to avoid and minimize potential impacts.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
4.14 Public Services		
CC4.14a	Light rail will bring crime into the neighborhood.	As described in Section 4.14, Public Services, incidences of crime are most likely to occur at the stations and park-and-rides; however, crime is not expected to increase as a result of operation of the stations. Several studies have concluded that crime around stations mirrors crime rates in the surrounding neighborhoods. Most areas in the project corridor have low crime rates (see Section 4.14 for information on crime rates). Sound Transit would implement a number of measures to deter crime in the station areas. Measures to minimize crime would include the use of equipment (e.g., closed-circuit TV [CCTV], sealed fare boxes, and automatically sealed exits), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel. 2010 crime statistics show that the crime rate per number of riders at transit facilities and on light rail and commuter rail trains is substantially lower compared to overall per capita crime rates in Seattle, Tukwila, and SeaTac.
4.16 Historic and Archaeological Resources		
CC4.16a	The Bellevue Way SE alternatives impact the Winters House, a historic resource.	FTA, in consultation with SHPO, has made a determination of adverse effect for the project under Section 106. This determination results from the project's potential impact on the Winters House. Where potential long-term or permanent operation impacts could occur to the Winters House from *Preferred Alternative B2M*, project design mitigates and resolves the potential impact. Operation of *Preferred Alternative B2M* within proximity to the Winters House would include standard vibration mitigation measures and floating slab, if necessary, to eliminate groundborne noise impacts. None of the project alternatives would result in visual impacts that could diminish the integrity of the characteristics that qualify the Winters House for National Register of Historic Places inclusion or eligibility. In addition to incorporating conditions into the project to avoid potential impacts, *Preferred Alternative B2M* would also provide a benefit to the historic resource by restoring the front yard consistent with the historic landscape and add interpretive signage. The construction impacts of the nonpreferred Segment B alternatives would not remove or diminish the character-defining features of the property. *Preferred Alternative B2M* has the potential to impact the Winters House during construction. Implementation of mitigation measures would resolve these potential impacts. A Memorandum of Agreement to refine the mitigation measures for the Winters House is included in Appendix I.
CC4.16b	Segment C alternatives impact the potential Surrey Downs Historic District.	FTA, in consultation with SHPO, has made a determination of adverse effect for the project under Section 106. This determination results from the project's potential impact on the potential Surrey Downs Historic District. None of the Segment C alternatives were found to have impacts on the potential Surrey Downs historic district during project operations. However, *Preferred Alternative C11A* and Alternatives C4A, C2T, and C3T would have potential construction impacts to the potential Surrey Downs historic district. These potential impacts would be resolved with construction minimization measures. Construction of these alternatives would introduce visual, audible, and atmospheric elements that would temporarily change the setting of the eligible historic district. However, the alternatives would not alter or remove contributing resources to the district and it would retain its architectural cohesiveness. Please refer to Section 4.16 of the Final EIS for a discussion of potential impacts and mitigation for the potential historic district. A Memorandum of Agreement to refine the mitigation measures for this resource is included in Appendix I.
4.17 Parks and Open Space		
CC4.17a	Segment B alternatives impact Mercer Slough Nature Park.	All Segment B alternatives would affect the Mercer Slough Nature Park to varying degrees. Consistent among all Segment B alternatives, however, is that they run on the edge of the park along existing highways and major arterials to minimize impacts. Alternative B1 would have the least permanent impact, and Alternative B2E would have the least construction impact. Park impacts are discussed in Section 4.17, Parkland and Open Space. Impacts on Mercer Slough Nature Park would be mitigated for all Segment B alternatives through acquisition of replacement land for permanent impacts, financial compensation, and restoration and potential enhancement of disturbed park area.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
CC4.17b	Proposed alternatives in Segment C impact Surrey Downs Park and could delay implementation of the Surrey Downs Park Master Plan.	As described in Section 4.17, Parkland and Open Space, the permanent impact area to the park would range from 0 acre to 0.5 acre, depending on the project alternative and the connection to Segment B. Permanent impacts on the park would be limited to the eastern edge along 112th Avenue SE for *Preferred Alternative C11A* and Alternatives C2T, C3T, C4A, and C7E. *Preferred Alternative C9T* includes realignment of SE 4th in the northeast section of the park. All park impacts would be mitigated. Alternatives C2T and C3T connecting to Alternative B2A would require closure of the northern section of the park currently occupied by the King County District Court, thus resulting in temporary impacts. The area currently used as park would remain open during this period. Other project alternatives, including *Preferred Alternatives C11A* and *C9T*, would not close the park during construction, and only a small section along 112th Avenue SE would be directly affected. The remainder of the park would continue to function. *Preferred Alternative B2M* connecting to *Preferred Alternative C9T* or Alternatives B2A or B2E would provide a station south of the park along 112th Avenue SE, thereby improving access to the park. Sound Transit would restore the park to pre-project conditions after construction. Most of the recreational areas of the park would be available for use during construction. If construction of the park Master Plan has not begun prior to East Link construction, Sound Transit would restore the park to pre-project conditions or make it consistent with the Master Plan, as appropriate. If the Master Plan has not been implemented prior to East Link construction, the project would facilitate park development by relocating the King County District Court. Unless park development and the East Link project construction timing coincide, the East Link project would not delay park development.
CC4.17c	Proposed alternatives destroy existing parks.	None of the proposed project alternatives would destroy existing parks. As discussed in Section 4.17, Parkland and Open Space, all Segment B alternatives, most Segment C alternatives, and all Segment E alternatives would have impacts on existing parks. However, all of these impacts would be mitigated through replacement of permanently affected parkland, financial compensation financial compensation to the jurisdiction for use of parkland during construction, and restoration of disturbed area after construction, as described in Section 4.17. In addition, some of the proposed alternatives would facilitate development of future planned parks in the City of Bellevue's Parks and Open Space System Plan (open space buffer area on the south side of Main Street, development of Pocket Park, and Surrey Downs Park), or result in increased park area in McCormick Park after construction.
CC4.17d	Various alternatives impact McCormick Park, an important buffer area between the neighborhood and downtown Bellevue, during construction and operation.	As stated in Section 4.17, Parkland and Open Space, McCormick Park is a neighborhood park that provides a buffer between the single-family residences to the north and high-density residential and commercial uses to the south. Alternatives C3T, C4A, and C8E would temporarily close portions of the park during construction for 4 to 5 years, but pedestrians would be directed to the open portions of the park during construction. While some project alternatives would temporarily change the visual quality and temporarily reduce the park's function as a buffer from adjacent uses, the park's function as a buffer would ultimately be restored. In addition, the project would result in an overall increase in park acreage after construction with the use of the construction staging area for park expansion. With these measures, light rail operating adjacent to the park would not reduce the viability of the area for park uses, especially considering its primary function as a buffer, because the existing park is currently adjacent to NE 12th Street, a 4-lane principal arterial with average daily traffic over 20,000 vehicles.
6. Alternatives Evaluation		
CC6.a	The project generates a small number of new transit riders, which would result in a higher cost per rider if only new riders were considered.	The East Link Project would attract new transit riders and benefit existing transit riders from the improved frequency, reliability, and travel time savings created by the project. In addition, as stated in Chapter 3, Transportation Environment and Consequences, by 2030 with the East Link Project, close to 10,000 more people would use transit than drive if bus service only is provided to the Eastside communities. A cost-effectiveness measure was chosen that could be used to compare route alternatives at the conceptual engineering stage of project development. Cost per rider was chosen as an effective way to compare route alternatives because it responds to both cost and project ridership. The benefits and use of the East Link project would extend over many decades, and annualizing the cost and ridership of the project reflects the project's long-term usefulness. Cost-effectiveness is discussed further in Chapter 6 of the Final EIS.

TABLE 7-1 CONTINUED
East Link Draft EIS – Responses to Common Comments

Common Comment No.	Common Theme	Common Response
General		
CCG1	Need more construction impact detail	Sound Transit has included an overview of potential construction impacts for each light rail profile type: At-grade, elevated, tunnel, and retained cut, in Section 2.4 of Chapter 2, Alternatives Considered. Construction impacts for each element of the environment and alternative are discussed in the corresponding sections of the EIS. As stated in Chapter 2, a detailed construction plan will be developed during final design. Sound Transit is committed to satisfying all applicable federal, state, and local environmental regulations and to responsibly and reasonably mitigate significant adverse environmental project impacts consistent with Sound Transit policies and applicable regulations. The Record of Decision for East Link issued after the Final EIS would include a list of committed mitigation measures for the project to be built. In addition, more detailed mitigation measures that address construction impacts would be refined through final design and the permitting process with the local jurisdiction. See also Response to Common Comment CCG3.
CCG2	Delay release of the Final EIS until Bellevue publishes their study of Alternative B7R	Bellevue's B7R study, which studies modifications to Alternative B7 and *Preferred Alternative C9T*, is briefly described in Chapter 2 of the Final EIS, and a summary of the study and comparison to the impacts of East Link Alternatives B7 and *C9T* is provided below in Section 7.6 of this chapter. Appendix K includes the full study.
CCG3	The EIS does not provide enough detail on the project design, impacts thereof, or especially mitigation of impacts.	The State Environmental Policy Act (SEPA) stipulates that the purpose of an EIS is to provide the public and decision makers with information about a proposal "at the earliest possible point in the planning and decision-making process, when the principal features of a proposal and its environmental impacts can be reasonably identified" (WAC 197-11-055(2)). Further, SEPA acknowledges that "the EIS need not analyze mitigation measures in detail unless they involve substantial changes to the proposal causing significant adverse impacts…"(WAC 197-11-440(6)(c)(iv). As stated in several places in the Final EIS, when a decision has been made to select the project to be built, the project would undergo additional engineering and design; mitigation measures would be refined during the final design, and the permitting process would be coordinated with local permitting authorities. The National Environmental Policy Act (NEPA) also states that "Agencies shall integrate the NEPA process with other planning at the earliest possible time to insure that planning and decisions reflect environmental values, to avoid delays later in the process, and to head off potential conflicts" and that the Federal agency "commences its NEPA process at that earliest possible time" (40 CFR 1501.2). It is standard practice to complete the NEPA process at approximately 10 to 15 percent level of design.

7.6 Review of City of Bellevue B7R Study

The City of Bellevue developed and studied modified designs for the BNSF Alternative (B7) connecting to the *Preferred 110th NE Tunnel Alternative (C9T*), referred to as B7-Revised (B7R). During the comment period for the SDEIS, the Bellevue City Council and several other members of the public requested that Sound Transit wait for their analysis of B7R to be developed prior to decision making by the Sound Transit Board (see comment letter ELS543 and Common Comment number CCG2). In response to the City's request, Sound Transit worked cooperatively with city staff and their design consultant throughout the winter and spring of 2011 as the city worked on the B7R design and environmental screening analysis.

This section of the Final EIS provides a comparison of impacts for the City of Bellevue's proposed B7R option with the BNSF Alternative (B7) connecting to *Preferred 110th NE Tunnel Alternative (C9T)* (referred to in this section as B7/C9T). Generally, the B7R follows a similar alignment as the B7/C9T (see Exhibit 7-1). Key differences between the B7R and the B7/C9T include the following:

- B7R has a light rail station (A2) located adjacent to and north of I-90 over the I-90/Bellevue Way SE interchange, with a pedestrian walkway to a new parking garage and bus transfer center on the west side of Bellevue Way SE (see Exhibit 7-2). Roadway access to the parking garage would be from Bellevue Way SE and 113th Avenue SE and require a new overpass over Bellevue Way SE.
- B7R does not have a 118th Station and does not serve the existing South Bellevue Park-and-Ride, which is assumed to be closed.

EXHIBIT 7-2
A2 Station and Parking

- B7R includes two options for accommodating the former BNSF Railway corridor's "railbanked" status. One option assumes joint, or shared use of tracks by light rail and freight or commuter rail trains, which is inconsistent with Sound Transit's design criteria. The second option accommodates space for future freight rail operations with an interim trail use, more consistent with Sound Transit's current design in the corridor.
- B7R is designed to connect to a revised Alternative C9T which would cross under Main Street, begin the tunnel portal north of Main Street and turn west at NE 2nd Street instead of Main Street, where *Preferred Alternative C9T* enters a tunnel portal.
- B7R would be on a retained fill 4 to 6 feet high on the east side of Sturtevant Creek near the Hilton Hotel, requiring relocation of the creek and reducing the stream buffer width by approximately one-third. B7R would cross the creek with a low-profile bridge.

Costs were not developed with the same assumptions as Sound Transit's cost analysis and therefore are not directly comparable. However the City of Bellevue's estimates declare a difference of approximately $10 to $14 million more than the East Link B7 and *C9T* alternative combination; approximately $150 million more than the *Preferred Alternative B2M* and *C9T* combination; and approximately $400 million more than the *Preferred Alternative B2M* and *C11A* combination.

The information in the following comparison originates from the City's Interim Analysis Report (found in Appendix K of this Final EIS) and the supporting technical memorandum as developed for the City of Bellevue and found on the City of Bellevue's Web site at http://www.ci.bellevue.wa.us/b7-revised-light-rail-route.htm. Where effects differed between the Interim Analysis Report and the technical memorandum, this comparison defers to the technical memorandum.

Not all elements of the environment were directly analyzed by the City and methodologies applied by the City's study for some elements of the environment are not entirely consistent with the methodologies used for the Final EIS analysis. The environmental study prepared by the City is not intended to be an EIS level analysis to compare against the B7 and C9T alternatives in the Final EIS. In general, many of the B7R analyses depended on information available in the Draft EIS or Supplemental Draft EIS and in other cases, impacts were discussed qualitatively. For these reasons, the data are not equivalent to the data found elsewhere in this Final EIS.

This section also describes differences in analysis methodologies where applicable. The following environmental categories analyzed in this Final EIS were not evaluated in the B7R study and they are not discussed here: Land Use, Air Quality and Greenhouse Gases, Energy Impacts, Geology and Soils, Hazardous Materials, Electromagnetic Fields, Public Services, Utilities, Historic and Archaeological Resources, and Cumulative Impact Analysis. For categories that were analyzed quantitatively, Table 7-2 presents the comparison between B7R and B7/C9T. The City's design modifications and study thereof terminate at the Bellevue Transit Center Station in the middle of Segment C. In order to offer a relative comparison, the data for impacts associated with the area between the Bellevue Transit Center and the Segment D boundary are assumed to be the same as the *Preferred Alternative C9T*.

7.6.1 Transportation

Technical memoranda were completed for B7R light rail ridership and traffic impacts near South Bellevue Way and I-90 only. The transit ridership forecasts prepared for B7R are consistent with the methods used to prepare ridership forecasts for alternatives described in the EIS. The B7R study utilized Sound Transit's ridership model using the same transit network model coding, assumptions, and inputs as done for the Final EIS. Results indicate that the A2 Station in Segment B would generate greater ridership compared to the 118th Station. B7R ridership would slightly decrease at other stations in Segments A and C, and ridership would remain constant in Segments D and E. Projectwide daily ridership would increase to 50,500 with B7R, compared to 49,000 with B7/C9T. While the traffic analysis was generally conducted using reasonable assumptions, and in accordance with professional practice, it does not provide a point of direct comparison between the B7R and EIS alternatives. The methods and assumptions used for Sound Transit's East Link Final EIS travel demand modeling and traffic operations analysis were developed based on input from state and local agency staff and the applicable long-range plans. While a partial discussion of the transportation methods and assumptions is included in the B7R study, the detailed information necessary to determine if the approach was consistent with this East Link Final EIS is not fully evident.

TABLE 7-2
Summary Comparison of B7R and B7/C9T

Resource		**City of Bellevue's B7R Option**			**B7/C9T Alternatives**
		From Segment A to Bellevue Transit Center Station[a]	**C9T from Bellevue Transit Center Station to Segment D**[b]	**B7R Total**	
Ridership[c]	Segments B and C	12,500		**12,500**	**10,500**
	Projectwide	50,500		**50,500**	**49,000**
Noise Impacts[e]		239	100	**339**	**316**
Acquisitions	Full	25	3	**28**	**20**
	Partial	10	13	**23**	**30**
Residential displacements		12	0	**12**	**0**
Business displacements (no. of employees)		9 (215)	10 (100)	**19 (315)**	**24 (370)**
Wetland (acres permanent)		2.1	0	**2.1**	**1.9**
Wetland buffers (acres permanent)		1.0	0	**1.0**	**0.5**
Parks (acres permanent and temporary)[e]		2.3[d]	0.4	**2.7**[d]	**3.0**

[a] Source: City of Bellevue B7R Interim Analysis Report (2011).
[b] Source: Applying East Link Project impacts for C9T north of Bellevue Transit Center in order to compare against impacts from East Link Project B7 and C9T combination.
[c] Ridership is calculated for segment combinations and is not available for areas less than the segment level.
[d] Includes 2.3 acres included in B7R analysis and 0.4 acre of impact to NE 2nd Pocket Park from Bellevue Transit Center Station entrance. Impacts to pocket park might be greater but are not identified in B7R analysis.
[e] Where effects differed between the Interim Analysis Report and the technical memorandum, this comparison defers to the technical memorandum.

These methods and assumptions could have substantial influence on any conclusions from the transportation modeling and operational analysis.

An example of how different approaches can influence the analysis is evident in the preparation of the travel demand forecasts. For this Final EIS, forecasts were primarily developed using the Puget Sound Regional Council's regional travel demand model, while forecasts for the City of Bellevue's B7R study relied on the Bellevue-Kirkland-Redmond (BKR) model. While these two models have some similar characteristics, they are not expected to produce similar forecasts. A comparison of the future traffic volumes used in the two analyses suggests up to a 20 percent difference in roadway traffic volumes along the Bellevue Way SE and 112th Avenue SE portion of the study area.

According to the B7R study, the intersection of SE 30th St and Bellevue Way SE would not meet WSDOT intersection LOS standards and would operate worse with B7R than under the No-Build condition, therefore requiring mitigation. With mitigation, B7R would result in improved traffic operations along Bellevue Way SE compared with B7, which does not affect or change this roadway. The other two intersections studied under the B7R alternative would meet the City of Bellevue's LOS standards. At the Bellevue Way SE/South Bellevue Park-and-Ride/112th Avenue SE intersection, this intersection would operate acceptably in either the B7 or B7R conditions, but it would have quite different characteristics because with Alternative B7 the South Bellevue Park-and-Ride would remain open at its current location, while under B7R the park-and-ride is relocated to the A2 Station site. Intersections where impacts occur with Alternatives B7 and C9T, including near the East Main and Bellevue Transit Center Stations, were not studied for B7R and therefore it is unknown how they would operate under the B7R alternative.

7.6.2 Environmental Consequences

7.6.2.1 Acquisitions, Displacements and Relocations

The proposed B7R would have 12 residential relocations in order to build the garage, transit center and access for the A2 Station (Exhibit 7-2). These would not occur with B7/C9T. B7R would have one more property acquisition (51) than B7/C9T (50), with more full acquisitions (28) than B7/C9T (20 total). The additional full acquisitions are primarily associated with the garage and transit center serving the A2 Station. The site identified by the Low Income Housing Institute (LIHI) for a low-income housing complex on NE 2nd Street would be acquired for the tunnel construction. Alternative B7/C9T would displace five more businesses than B7R due to acquisitions for the 118th Station.

7.6.2.2 Economics

B7/C9T would displace more employees (370) than B7R (315). It is unknown how the City of Bellevue study calculated employee displacements, so it is unknown if this methodology is consistent with that used by Sound Transit.

7.6.2.3 Social Impacts, Community Facilities, and Neighborhoods

Although not discussed in great detail, nor using the Final EIS methodology, the Early Environmental Technical Memorandum (published in May 2011) claims that the B7R garage, transit center and access for the A2 Station would substantially change the character of the Enatai neighborhood because it would add intense activity, change neighborhood views and alter traffic patterns. B7/C9T would not result in these impacts. The study also states that extensive mitigation would be necessary to reduce impacts on the Enatai neighborhood from the B7R, although these mitigation measures are not outlined. Potential acquisition of the LIHI housing complex could result in an environmental justice impact. In other areas, the impacts of B7R would be similar to B7/C9T.

7.6.2.4 Visual and Aesthetic Resources

While the B7R study does not evaluate visual impacts using the Final EIS methodology, or at the same level of detail as this EIS, the study does identify a potentially significant visual impact caused by the parking garage for the A2 Station. The upper level of the parking garage would be visible from the neighborhood and lit at night, potentially resulting in some light spillover for residences west of 113th Avenue SE. The east side of the garage would be up to 40 feet above Bellevue Way SE and, along with the access ramp over Bellevue Way SE, would change views from Bellevue Way SE and areas east, including Mercer Slough Nature Park. Based on the B7R analysis, it appears that B7R would have adverse visual effects. B7/C9T would not result in visual impacts.

7.6.2.5 Noise and Vibration

For the portion up to the Bellevue Transit Center Station the City of Bellevue identified more moderate impacts (193) for B7R as compared to B7/C9T (148), but less severe impacts (46) than compared to B7/C9T (68). Overall, including the entire route to Segment D, B7R would have slightly more total impacts (339) than B7/C9T (316). However, B7R identifies some impacts in locations that are unlikely to occur based on the Final EIS analysis, such as the south side of I-90 and on

112th Avenue SE. While many of the impacts along the proposed B7R route would be similar to B7 /C9T as described in this Final EIS, noise impacts around the garage at the A2 Station would result in additional impacts. The B7R study indicates that the impacts from the station would be from cars and buses, not light rail, although it also states a traffic noise analysis was not completed, so it is unclear whether these impacts are counted or not. An analysis of traffic noise impacts would be needed to more accurately compare these alternatives.

7.6.2.6 Ecosystem Resources

The difference in ecosystem impacts between B7R and B7/C9T cannot be directly compared because the B7R study analysis does not include the same impact measures or the same level of detail as the analysis completed in this Final EIS. The study does state that B7R would impact a total of 2.1 acres of wetlands, compared with 1.9 with B7/C9T, and 1.0 acre of wetland buffer, compared with 0.5 acre with B7/C9T. This increase would be due to the access ramp to the A2 Station parking garage, which would affect 0.3 acre of Mercer Slough Category 1 wetland and 0.2 acre of wetland buffer that would not be impacted by B7/C9T. Construction of the additional support columns needed for the A2 Station would disturb a greater area of soil and vegetation in the Mercer Slough wetland buffer and would have greater potential to disturb the I-90 Seismic Retrofit Wetland Mitigation Site than B7/C9T. A longer construction period and greater ground disturbance for the A2 Station would increase potential for pollutant runoff to enter the slough compared with B7/C9T.

B7R would bridge and realign a portion of Sturtevant Creek near the Hilton Hotel. This reach of the stream has good quality habitat downstream of the existing culvert under I-405. B7R would also result in a reduction of approximately one-third of the stream buffer compared with existing conditions or the B7/C9T. The *Preferred Alternative C9T* connecting from B7 would also affect the stream buffer in this location. However, the guideway for C9T would be elevated, most of the stream buffer would be preserved, and it would not be necessary to realign the creek. The B7R study states that impacts on Sturtevant Creek would be greater than B7, but no discussion of specific impacts on Chinook salmon, sockeye salmon, or cutthroat trout habitat is provided. After this portion of the stream is relocated, B7R would result in a wider stream buffer in this location than B7. It would be more difficult to obtain permits for B7R than for B7/C9T because B7R would require permanent relocation of a portion of Sturtevant Creek with good quality aquatic habitat and construction of a low-profile bridge over the creek. Although the bridge is intended to avoid extending the I-405 culvert, the bridge profile would be less than 10 feet from the stream surface. The evaluation of costs and the ability to mitigate impacts from B7R are uncertain.

7.6.2.7 Water Resources

The B7R study has a qualitative discussion of pollutant-generating impervious surface (PGIS). The study reports that B7R would have a greater increase in PGIS than B7/C9T because the A2 Station parking garage and transit center would result in 4.1 acres of PGIS compared with 2.9 with the 118th Station. The B7R study states that a pollutant loading analysis would be required to determine if impacts on water quality in Mercer Slough would still occur after basic treatment of stormwater. Changes in non-PGIS are estimated in the B7R study to be similar to B7/C9T for the B7R corridor beyond the A2 Station.

7.6.2.8 Parkland and Open Space

The B7R study identifies 2.3 acres of impact on Mercer Slough Nature Park from B7R, compared with 2.6 acres with B7. The B7R study does not discuss impacts on the NE 2nd Street Pocket Parks. The proposed realignment for B7R clearly affects this park and therefore the associated impacts of the *Preferred Alternative C9T* (0.4 acre) are included in Table 7-2 for both B7R and for B7/C9T.

Appendix A2

List of Preparers

Appendix A2

List of Preparers

A2.1 Public Agencies

Federal Transit Administration (FTA)

John Witmer, Community Planner
B.S., Economics (1984)
M.P.A., Master of Public Administration (1990)

Washington State Department of Transportation

Paul Krueger, Environmental Review
I-90 Corridor and Sound Transit Environmental Manager
B.A., Art History (1992)
M.L.A., Landscape Architecture (1996)

A2.2 Sound Transit

Brooke Belman, Community Outreach Program Manager
B.A., History (1997)

Don Billen, Project Manager
B.A., Peace and Global Studies (1989)
M.P.A., Master of Public Administration (1996)
M.S., Transportation Engineering (1997)

Elma A. Borbe, Environmental Planner
B.A. Community, Environment, and Planning (1987)
M.U.P. Master of Urban Planning (1992)

Sue Comis, Project Manager
B.A., Psychology (1975)
M.U.P., Master of Urban Planning (1980)

Paul Cornish, Project Manager
B.S., Civil Engineering (1989)

Kent Hale, Senior Environmental Planner
B.A., History (1993)
M.A., Applied Geography (1997)

James Irish, Link Environmental Manager
B.A., Philosophy (1977)
M.L.A., Landscape Architecture (1989)

Katie Kuciemba, Community Outreach Corridor Lead
B.A., Political Science (2000)
B.A, Communications (2000)
M.A., Political Management (2005)

Brant Lyerla, Project Development Coordinator
B.A., Architecture (1993)
M.B.A., Information Systems Management (1994)
M.S., Transportation Engineering (2003)

Leonard McGhee, Project Manager
B.A., Social Science (1976)
B.A., Social Ecology (1976)
M.U.P., Urban Planning (1983)

Lauren Swift, Environmental Planner
B.A., Environmental Studies, (1992)
M.A., Regional Planning, (1995)

Andrea Tull, Senior Planner
B.A. English (1980)
B.A. Political Science (1980)
M.P.A., Master of Public Administration (1984)

Michael Williams, Link Project Development Manager
B.A., Public Administration (1977)
M.U.P, Masters of Urban Planning (1980)

Tom Wilson, Sound Transit Right-of-Way Engineering Manager
B.A., Business (1988)

Ellie Ziegler, Environmental Planner
B.A., Environmental Studies (1999)
B.S. Fisheries Sciences (2004)

A2.3 Sound Transit Consultants

Axis Environmental

Kristin Noreen, Biological Assessment Preparer
B.S., Natural Resource Conservation (1991)
Professional Certificate, Environmental Law and Regulation (2003)

Sasha Visconty, Biological Preparer
M.S., Marine Affairs (1997)
B.A., Editorial Journalism/Environmental Policy

Berk and Associates

Jay Rogers, Economist
B.A., Economics and Business Administration (2001)

Erik Rundell, Economist
B.A., Geography (2002)
Master of Urban and Regional Planning (2007)

Bolima Drafting

Kelly McGee, CAD Manager
B.S., Psychology (1993)

Hank Jorinssen, CAD Manager
AA., Applied Sciences (1988)

CH2M HILL (Primary Consultant for EIS)

Donald Anderson, Geology and Soils Lead
B.S., Civil Engineering (1966)
M.S., Civil Engineering (Geotechnical) (1968)
Ph.D., Civil Engineering (Geotechnical) (1974)

Mark Assam, Public Services/Electromagnetic Fields/Senior Review/Final EIS Technical Review Lead
B.S., Cell and Molecular Biology (1990)
Certificate, Community Planning (1995)

Rachel Chang, Hazardous Materials Analyst
B.S., Biomedical Engineering (1989)
M.S., Environmental Engineering (1991)

Jeff Crisafulli, Editor
B.A., English (1991)

Eileen Davis, Environmental Planner
B.A., Social and Environmental Issues (2007)

Hans Ehlert, Ecosystems Analyst
B.S., Forestry (1987)
M.S., Silviculture (1989)

Kristina Evanoff, Relocations and Acquisitions/Utilities/Transportation
B.S., Geography (2000)
B.S., Environmental Studies (2000)
Certificate, Geographic Information Systems (2003)
M.S.E., Civil Engineering (2006)
Graduate Certificate, Geographic Information Systems (2005)

Craig Grandstrom, Transportation Engineer
B.S., Civil Engineering (1999)

Mark Greenig, Visual Impacts and Aesthetics Analyst
B.S., Landscape Architecture (1978)
M.U.P., Urban Planning (1985)

Dave Hedglin, Cost Estimator
A.A., Construction Management (1981)
A.S., Arts and Sciences (1973)

Jill Irwin, Editor
B.A., Art History (1980)
Certificate, Technical Writing (1994)

Monica Joyce, Transportation Planner
B.A., Urban Studies (2004)
M.S., Environmental Science (2004)

Steve Kambol, Project Manager
B.S., Civil Engineering (1975)
M.S., Transportation Engineering (1977)
M.A., History (1981)

Katina Kapantais, Ecosystems Analyst
B.A., Ornithology (1999)
M.S., Environmental Science (2004)

Arjun KC, Water Resources Analyst
B.S., Civil Engineering (2001)
M.S., Environmental Engineering Science (2003)

Jodi Ketelsen, Purpose and Need Lead/Planning Manager/Cumulative Impacts Lead
B.S., Landscape Architecture (1989)
M.C.P.L., City Planning (1994)
M.L.A.R., Landscape Architecture (1994)

Heidi Loeffler, Environmental Planner
B.A., Environmental Studies (2003)

Sandra Schwabel McGinnis, Geology and Soils Analyst
B.S., Environmental and Engineering Geology (1995)

Andrew Leong, Engineering Manager
B.A., History, German (1971)
M.A., History, German (1973)

Stephen Mak, Civil Design Lead, Segment B
B.S., Civil Engineering (1997)

Raymond Mok, Civil Design Lead, Segment C
B.S.C.E, Civil Engineering (1997)

Jennifer Moore-Arterburn, Editor
B.S., English and Journalism (1993)
M.T.S.C., Technical and Scientific Communication (1997)

Thomas Mudayankavil, Civil Design Lead, Segment A
B.S., Civil Engineering (1986)
M.S., Civil Engineering (1992)

Kevin Murphy, Transportation/Energy Analyst
B.S., Geography (1986)

Bob Pearson, Electromagnetic Fields Analyst
M.S., Remote Sensing of Natural Resources (1971)
Ph.D., Remote Sensing of Natural Resources (1973)

Kurt Playstead, Energy Analyst
B.S., Economics (1994)
M.B.A. (2004)

Rob Rodland, Land Use/Neighborhoods/Public Services/Environmental Justice Analyst
B.A., Geography (2000)

Gery Rudolph, Graphics Designer
General Equivalency Diploma (GED) (1980)

Grahm Satterwhite, Transportation Engineer
B.S., Civil Engineering (2005)

Brian Shinn, Deputy Engineering Manager
B.S., Civil Engineering (1984)

Michael Stephan, Visual Simulations Lead
A.S., Engineering Drafting Technology (1981)

Pete Sturtevant, Water Resources
B.S., Biology (1971)
M.S., Water Resources Management/Civil Engineering (1974)

Alisa Swank, Purpose and Need, Relocations and Acquisitions/Utilities/Final EIS Technical Review Lead
B.A., Environmental Studies (1999)
M.S., Environmental Science (2004)

Ellen Talbo, Transportation Planner
B.A., Urban Studies (2004)
M.U.P., Urban and Regional Planning (2006)

Randy Whitman, Aquatic Resources Analyst
B.S., Fisheries Sciences (1976)
M.S., Fisheries Sciences (1987)

Dan Winstanley, Project Controller
B.S., Geology (1977)
M.S., Hydrogeology (1985)

Tony Woody, Transportation Engineer
B.S., Civil Engineering (2000)
M.S., Civil Engineering (2006)

Critigen

Rob Grabarek, Geographic Information System Analyst
B.A., Psychology (2001)
Certificate, Geographic Information System (2005)

Steve Savage, Geographic Information System Analyst
B.S., Forest Management (2003)

Anna Yost, Geographic Information System Analyst
B.A., Environmental Studies (1999)
Certificate, Geographic Information Systems (2007)

Entech Consulting Group

Joza Burnam, Air Quality Analyst
B.S., Environmental Science (2006)

Michelle Jones, Air Quality Analyst
B.S., Civil Engineering (1992)

Grijalva Engineering

Gabe Grijalva, Civil Design Lead, Segments D and E
B.S., Civil Engineering (1984)

Historical Research Associates, Inc. (HRA)

Brent Hicks, Cultural/Archaeological Resources Analyst
M.A., Anthropology/Archaeology (1991)

Erica Kachmarsky, Historical Resources Analyst
B.A., Anthropology/Archaeology (2000)
M.A., Preservation Studies (2002)

Gail Thompson, Historic Properties and Cultural Resources Analyst
B.A., Anthropology (1969)
M.A., Anthropology (1971)
Ph.D., Anthropology (1978)

Harris Miller Miller & Hanson, Inc. (HMMH)

Lance Meister, Noise and Vibration Analyst
B.S., Civil Engineering (1994)

INCA Engineering

Bill Higgins, Water Resources
B.S., Civil Engineering (1977)
M.S., Industrial Engineering (1993)
M.B.A., Operations Management and Finance (1984)

Michael Minor and Associates

Michael Minor, Noise Analyst
B.A., Physics (1988)
B.A., Mathematics (1988)

PRR

Rita Brogan, Public and Community Relations Coordinator
B.S., Editorial Journalism (1972)
M.S., Communications (1975)

Kirsten Hauge, Public and Community Relations Coordinator
B.A., Communications (2001)

Laura LaBissoniere-Miller, Public and Community Relations Coordinator
B.A., Communication and English (2008)

Jamie Strausz-Clark
B.A., Political Science (1994)
M.A., Public Policy (2000)

Wakerobin LLC

Ardith Lanstra-Nothdurft, Wetlands, Analyst
B.A., Planning and Design (1993)
M.L.A., Landscape Architecture (1996)
Wetland Science and Management Certificate (1999)
M.B.A., Master Business Administration (2009)

White Shield, Inc.

David R. Polivka, Hazardous Materials Analyst
B.A., Geology (1979)
M.S., Geology (1984)

Appendix A3

List of Recipients

Appendix A3

List of Recipients

All commenters on the Draft EIS and the Supplemental Draft EIS have been added to the list of recipients for this Final EIS. Their names and affiliation, if provided, are listed in Appendix J.

A3.1 Federal Agencies

- Advisory Council on Historic Preservation
- Federal Aviation Administration
- Federal Emergency Management Agency
- Federal Highway Administration
- Federal Motor Carrier Safety Administration
- Federal Railroad Administration Region 8
- Transportation Security Administration US Homeland Security
- National Oceanic and Atmospheric Administration
- National Park Service
- U.S. Army Corps of Engineers
- U.S. Bureau of Indian Affairs
- U.S. Coast Guard
- U.S. Department of Commerce
- U.S. Department of Fish and Wildlife
- U.S. Department of the Interior/National Park Service
- U.S. Environmental Protection Agency (Region 10)

A3.2 Tribes

- Muckleshoot Tribe
- Snoqualmie Tribe
- Suquamish Tribe
- Tulalip Tribes
- Yakama Nation
- Duwamish Tribe

A3.3 State Agencies

- Washington State Department of Community Trade and Economic Development
- Washington State Department of Ecology
- Washington State Department of Fish and Wildlife
- Washington State Department of Health
- Washington State Department of Natural Resources Interagency Committee for Outdoor Recreation
- Washington State Department of Social and Health Services
- Washington State Recreation and Conservation Office
- Washington State Department of Archaeology and Historic Preservation
- Washington State Office of the Attorney General
- Washington State Parks and Recreation Commission
- Washington State Patrol
- Washington State Office of Governor
- Washington State House of Representatives
- Washington State Joint Transportation Committee
- Washington State Senate
- Washington State Utilities and Transportation Commission

A3.4 Regional Agencies

- Port of Seattle
- Puget Sound Clean Air Agency
- Puget Sound Regional Council

A3.5 County Agencies

- King County
- Pierce County
- Snohomish County

A3.6 Transit Agencies

- Community Transit
- Everett Transit
- King County Metro Transit
- Pierce Transit

A3.7 Cities

- City of Bellevue
- City of Clyde Hill
- City of Issaquah
- City of Kirkland
- City of Medina
- City of Mercer Island
- City of Redmond
- City of Seattle
- Town of Beaux Arts Village

A3.8 Libraries

- Bellevue College Library
- King County Library System

  - Bellevue Regional Library
  - Mercer Island Public Library
  - Redmond Regional Library
- Library Municipal Research and Services of Washington
- Seattle Public Library History Department
- Seattle Public Library Branches
  - International District /Chinatown Branch Library
  - Douglas Truth Branch Library
- University of Washington Libraries
- Washington State Department of Transportation Library
- Washington State Library
- Washington Talking Book and Braille Library

A3.9 Schools and Community Centers

- Bellevue School District
- Mercer Island School District
- Lake Washington School District No. 414
- City of Bellevue Community Centers
- City of Mercer Island Community Center
- City of Redmond Community Centers
- City of Seattle Community Centers
  - International District/Chinatown Community Center
  - Garfield Community Center
  - Yesler Community Center
- City of Seattle Neighborhood Service Centers
  - Downtown Service Center
  - Central Service Center
  - Southeast Service Center
- Seattle Public Schools

A3.10 Utilities

- 360 Networks
- Abovenet
- Allstream Communications
- Comcast
- Frontier Communications NW
- King County Wastewater
- Integra Communications
- Level 3 Communications
- Microsoft
- Olympic Pipeline
- Puget Sound Energy
- Qwest
- Seattle City Light
- Seattle Public Utilities
- TW Telecom
- Verizon Business / MCI

A3.11 Business and Community Organizations

- Ames Lake Community Club
- Asian Counseling and Referral Services
- Bellecrest Neighborhood Association
- Bellevue Chamber of Commerce
- Bellevue Downtown Association
- Bellevue Marts Museum
- Bellevue Network on Aging
- Burlington Northern Santa Fe
- Chinese Information Service Center
- Coalition for Effective Transportation Alternatives
- Concord Hill Homeowners
- Crossroads Community Center
- Downtown Seattle Association
- East Lake Sammamish Community Association

Acronyms and Glossary

Appendix A4

Acronyms and Glossary

General Acronyms and Abbreviations

AASHTO	American Association of State Highway and Transportation Officials
ADA	Americans with Disabilities Act
ADT	Average Daily Traffic
AM	morning
ANSI	American National Standards Institute
APE	Area of Potential Effect
AQMA	Air Quality Maintenance Area
ASC	Ambulatory Surgery Center
AST	above-ground storage tank
ASTM	American Society for Testing and Materials
AWSC	all-way stop-controlled
AWD	average weekday
AWT	average wait time

BIA	Bureau of Indian Affairs
BMP	best management practice
Btu	British thermal unit

CAA	Clean Air Act
CAFÉ	corporate average fuel economy
CCTV	closed-circuit television
CEQ	Council on Environmental Quality
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
cfs	cubic feet per second
CH_4	methane
CNG	compressed natural gas
CO	carbon monoxide
CO_2	carbon dioxide
CO_2e	carbon dioxide equivalent
CPP	Countywide Planning Policy
CPR	cardiopulmonary resuscitation
CPTED	Crime Prevention Through Environmental Design
CT	Community Transit
CTED	Washington State Department of Community, Trade, and Economic Development
CWA	Clean Water Act

DAHP	Washington Department of Archaeology and Historic Preservation
dB	decibel
dBA	A-weighted decibel
DC	direct current
DOE	U.S. Department of Energy
DPM	diesel particulate matter
Draft EIS	Draft Environmental Impact Statement
DRO	diesel-range organics
DSHS	Department of Social and Health Services

EIA	Energy Information Administration
Ecology	Washington State Department of Ecology
Ecology Manual	*Stormwater Management Manual for Western Washington* (Washington State Department of Ecology, 2005)
EIS	Environmental Impact Statement
EMF	electromagnetic field
EMI	electromagnetic interference
EO	Executive Order
EPA	United States Environmental Protection Agency
ERIC	Eastside Refugee and Immigrant Coalition
ESA	Endangered Species Act

FAA	Federal Aviation Administration
FAQ	frequently asked question
FAZ	Forecast Analysis Zone
Final EIS	Final Environmental Impact Statement
FEMA	Federal Emergency Management Agency
FFGA	Full Funding Grant Agreement
FHWA	Federal Highway Administration
FLSC	Fire/Life Safety Committee
FIRES	finance, insurance, real estate, and services
FR	*Federal Register*
ft	feet
FTA	Federal Transit Administration

g/gal	gallons of gasoline

GHG	greenhouse gas
GIS	geographic information system
GMA	Growth Management Act
GWP	global warming potential
HAC	high-accident corridor
HAL	high-accident location
HCT	high-capacity transit
HFC	hydrofluorocarbon
HGM	hydrogeomorphic classification
Horizon	Horizon Systems Corporation
HOT	high-occupancy toll
HOV	high-occupancy vehicle
HPA	Hydraulic Project Approval
HVAC	heating ventilation and air conditioning
Hz	Hertz
HUD	Department of Housing and Urban Development
I-90	Interstate 90
I-405	Interstate 405
IPCC	Intergovernmental Panel on Climate Change
JRPC	Joint Regional Policy Committee
KCM	King County Metro
KOP	key observation point
kV	kilovolt
lb	pound
lb/day	pounds per day
Ldn	24-hour, time-averaged, A-weighted sound level (day-night)
Leq	equivalent continuous sound level
LID	low-impact development
Lm	maximum noise level
Lmax	maximum noise level
LOS	Level of Service
LWCF	Land and Water Conservation Fund
MA	Memorandum Agreement
MBTA	Migratory Bird Treaty Act
METRO	King County Metro
mpg	miles per gallon
MPO	Metropolitan Planning Organization
MOA	Memorandum of Agreement
mph	miles per hour
MRI	magnetic resonance imaging
MSA	Magnuson-Stevens Fishery Conservation and Management Act
MSAT	mobile source air toxic
MTCA	Model Toxics Control Act
MTP	Metropolitan Transportation Plan
MVM	million vehicle miles
NAAQS	National Ambient Air Quality Standards
NEPA	National Environmental Policy Act
NFPA	National Fire Protection Association
NHPA	National Historic Preservation Act
NIOSHA	National Institute for Occupations Safety and Health
NMFS	National Marine Fisheries Service
NOA	Notice of Availability
NOI	Notice of Intent
NO_2	nitrogen dioxide
N_2O	nitrous oxide
No_x	oxides of nitrogen
NPDES	National Pollutant Discharge Elimination System
NPS	National Park Service
NRHP	National Register of Historic Places
O_3	ozone
OCS	overhead catenary system
OHWM	ordinary high water mark
ORO	oil-range organics
PCB	polychlorinated biphenyl
PCE	perchloroethylene (tetrachloroethene)
PFC	perfluorocarbon
PGIS	pollutant-generating impervious surface
PHS	Priority Habitat and Species
PM	afternoon, particulate matter
$PM_{2.5}$	particulate matter 2.5 microns or less in size
PM_{10}	particulate matter 10 microns or less in size
ppm	parts per million
PPV	peak particle velocity
PSCAA	Puget Sound Clean Air Agency
PSCOG	Puget Sound Council of Governments
PSRC	Puget Sound Regional Council

RCO	Washington State Recreation and Conservation Office
RCW	Revised Code of Washington
RFFA	reasonably foreseeable future action
RHL	Redmond Historic Landmark
rms	root mean square
ROD	Record of Decision
ROG	reactive organic gases
RTA	Regional Transit Authority
RTIP	regional transportation improvement program
RTP	regional transportation plan
RTPO	Regional Transportation Planning Organization
SAFETEA-LU	Safe, Accountable, Flexible and Efficient Transportation Equity Act: A Legacy for Users
SCAQMD	South Coast Air Quality Management District
SEM	sequential excavation mining
SEPA	State Environmental Policy Act
SHPO	State Historic Preservation Office
SIP	State Implementation Plan
SL	Seattle Landmark
SMC	Seattle Municipal Code
SMP	Shoreline Master Program
SF_6	sulfur hexafluoride
SO_2	sulfur dioxide
Sound Transit	Central Puget Sound Regional Transit Authority
sq ft	square feet
SR	state route
SSMP	safety and security management plan
ST2	Sound Transit 2
SWPPP	stormwater pollution prevention plan
TCP	traditional cultural property
TCRP	Transit Cooperative Research Program
TCQSM	Transit Capacity and Quality of Service Manual
TESCP	temporary erosion and sediment control plan
TIP	Transportation Improvement Plan
TMDL	total daily maximum load
TNM	traffic noise model
TPH	total petroleum hydrocarbon
TPSS	traction power substation
TRB	Transportation Research Board
TSM	transportation systems management
TSP	total suspended particulates
TWSC	two-way stop-controlled
$\mu g/m^3$	micrograms per cubic meter
USACE	United States Army Corps of Engineers
U.S.C.	United States Code
USDOE	United States Department of Energy
USDOT	United States Department of Transportation
USFWS	United State Fish and Wildlife Service
USGS	United States Geological Survey
UST	underground storage tank
v/c	volume to capacity ratio
VdB	vibration decibel
VHT	vehicle hours traveled
VMT	vehicle miles traveled
VOC	volatile organic compound
WAC	Washington Administrative Code
WASIST	Washington State Intersection Screening Tool
WDFW	Washington Department of Fish and Wildlife
WDNR	Washington Department of Natural Resources
WHR	Washington Heritage Register
WPZ	wellhead protection zone
WSDOT	Washington State Department of Transportation
WTCU	wholesale trade, transportation services, communication, and utilities sector

Glossary of Terms

Access Time. The time required to walk, bicycle, or drive from the origin of the trip (for example, from home) to a (boarding) transit stop, plus the waiting time based on the frequency of transit service, and/or the transfer time and the walking or driving time from the transit (de-boarding) stop to the destination. For auto trips, it is the time required to walk to and from parking places, and delays within parking facilities, if any.

Accessibility. The ease by which an individual can reach desired activities in any location by use of the transportation system.

Air Pollutant (also, Air Contaminant). Smoke, dust, fumes, or odors in the ambient air that have the potential for harmful effects.

Air Quality Maintenance Area (AQMA). An area having the potential to violate a federal or state ambient air quality standard, based on expected growth and development in the area.

Alignment. Horizontal geometric elements, which define the location of the light rail track or roadway.

Alluvium. An unconsolidated, terrestrial sediment composed of sorted or unsorted sand, gravel, and clay that have been deposited by water.

Alternative R-8A. The preferred alternative outcome of a 1998 study initiated by Sound Transit to study two-way transit and high-occupancy vehicle (HOV) lanes on I-90. The preferred alternative (R-8A) called for the construction of HOV lanes on the outside roadways and the dedication of the center roadway for future high-capacity transit operations.

Annualized Capital Cost. A one-time capital cost converted into an annual value that incorporates both the depreciation on the capital item and the foregone interest on the money invested in the project.

Archaeological Sensitivity Zone. An area where the potential for finding an archaeological resource is high.

Area Source. A general classification of the origin of an air pollutant (e.g., park-and-ride lots are area sources of carbon monoxide emissions).

Arterial. A major thoroughfare used mainly for through traffic rather than access to adjacent property. Arterials generally have greater traffic-carrying capacity than collector or local streets and are designed for continuously moving traffic.

Artifact. Any portable object used and/or modified by civilization (particularly during prehistoric times).

At-Grade. Term used to express that a feature, such as a rail track or crosswalk, and a roadway meet at the same elevation.

At-Grade Crossing. Any intersection of two or more flows of traffic at the same elevation (possibly involving more than one mode of transportation), such as road crossings by light rail.

Atmospheric Stability. A measure of the capacity of the ambient air to disperse air pollutants.

Attainment Area. An Attainment Area is an area considered to have air quality as good as or better than the national ambient air quality standards for specific pollutants as defined in the Clean Air Act.

Average Annual Megawatt. The average hourly demand for or supply of electricity measured in megawatts over a year.

Average Daily Traffic (ADT). The total volume of traffic during a given time period divided by the number of days in that time period, representative of average traffic in a one-day time period.

Average Time (also, Exposure Time). The duration of exposure to a given concentration of an air contaminant, specified in ambient air quality standards (e.g., the two national standards of 9 parts per million and 35 parts per million specify averaging times of 8 hours and 1 hour).

Average Wait Time (AWT). Average time spent by passengers at a station or bus stop waiting for transit service.

Average Weekday (AWD). A measurement of average conditions during one weekday, i.e., Monday through Friday.

A-Weighted Sound Level (dBA). To approximate the way humans interpret sound, a filter circuit with frequency characteristics similar to the human hearing system is built into sound measurement equipment. Measurements with this filter enacted are referred to as A-weighted sound levels, expressed in dBA. (See Decibel.)

Background Concentration. The pollutant level that would exist at a site in the absence of air pollution sources in the neighborhood of the site (different from Modeled Concentration).

Baseline Energy Consumption. Energy consumption, usually for a no-build alternative, that is used as a reference against which energy consumption for a build alternative is compared.

Boarding. Term describing the arrival of passengers onto a bus or transit vehicle.

Boarding Trips. A trip on a transit line or group of lines where each boarding of a transit vehicle is considered the start of a new trip. Number of trips boarding (entering) transit vehicles, regardless of whether the trip involves a transfer from another transit vehicle. A fare may or may not be collected for each boarding trip, depending on whether a transfer is used.

British Thermal Unit (Btu). An energy unit equal to the quantity of heat required to raise the temperature of 1 pound of water 1 degree Fahrenheit. One therm equals 1,000,000 Btu.

Capacity, Person. The maximum number of persons that can be carried past a given location during a given time period under specified operating conditions without unreasonable delay, hazard, or restriction. Usually measured in terms of persons per hour.

Capacity, Roadway. The maximum hourly rate at which persons or vehicles can reasonably be expected to traverse a point or uniform section of a lane or roadway during a given time period under prevailing roadway and traffic conditions.

Capacity, Vehicle. The maximum number of vehicles that can be accommodated in a given time by a transit or highway facility.

Capital Costs. Nonrecurring costs required to construct transit systems, including costs of right-of-way, facilities, rolling stock, power distribution and the associated administrative and design costs, and financing charges during construction.

Carbon Monoxide (CO). A colorless, odorless, tasteless gas, and one of the criteria air pollutants released from automobile exhaust.

Carpool. A group of passengers and drivers organized to use one automobile on a regular basis, riding together, for the same trip purpose (generally the work trip).

Cathodic Protection. Cathodic protection is an effective method of preventing stress-corrosion cracking. It is a technique used to control the corrosion of a metal surface by making that surface the cathode or terminal that transports the current.

Census Tract. A Census tract is a small subdivision of an urban area used by the U.S. Census Bureau to identify population and housing statistics. Census blocks are subdivisions of census tracts and are the smallest unit of census geography for which the Census Bureau collects data. The boundaries of census blocks are generally streets or other notable physical features and often correspond to a city block. A census block group is a combination of census blocks, typically encompassing two to four city blocks. The Census collects some information at the block level, some at the block group level, and some at the tract level.

Channelization. The use of traffic markings or islands to direct traffic into certain paths. For example, a "channelized" intersection directs portions of traffic into a left turn lane through the use of roadway islands or striping that separates the turn lane from traffic going straight.

Circulation. The free movement or passage of a vehicle, pedestrian, bicycle, or other transportation mode through a given area.

Concentration (also, level). A measure of the air pollutant in the ambient air, having the units of mass per volume.

Conformity. A process that ensures federal funding and approval goes to transportation activities consistent with federal air quality goals. The Federal Highway Administration and the Federal Transit Administration jointly determine that specific regions meet air quality standards.

Construction Energy. In transportation analysis, the energy used to build stations, terminals, roadbeds, trackbeds, tunnels, vehicles, and other equipment and facilities. Construction energy includes the energy content of materials and the energy used to haul and place them.

Construction Staging Area. During construction, a site temporarily used for materials or equipment storage, assembly, or other temporary, construction-related activities.

Corridor. A general path from one point to another; the East Link study corridor begins in Seattle and travels to Redmond.

Couplet. A place where a two-way street changes temporarily into a one-way paired set of streets.

Criteria Air Pollutants. Those air pollutants that have been recognized by the U.S. EPA as potentially harmful and for which standards have been set to protect the public health and welfare. The criteria air pollutants are carbon monoxide, sulfur dioxide, particulates, nitrogen dioxide, ozone, hydrocarbons and lead.

D2 Roadway. In Seattle, an HOV ramp onto I-90 between Downtown Seattle and Rainier Avenue.

Day Night Sound Level (Ldn). Ldn, also abbreviated DNL, is a 24-hour equivalent continuous sound level (Leq), but with a 10-dB penalty assessed to noise events occurring at night. Nighttime is defined as 10 p.m. to 7 a.m. This strongly weights Ldn toward nighttime noise because most people are more easily annoyed by noise during the nighttime hours when background noise is lower and most people are sleeping.

Decibel. The unit used to measure the loudness of noise.

Displacement. A property acquisition that would require removing an existing use.

Disturbed Habitat. A habitat in which naturally occurring ecological processes and species interactions have been significantly disrupted by the direct or indirect results of human presence and activity.

Drop-Off Zone. A station that provides temporary loading and unloading facilities for autos and/or buses. The station may be combined with feeder bus stations.

Ecologically Sensitive Area. An area, valued locally for its rare or sensitive habitat, existing in a relatively undisturbed, natural state and supporting indigenous species.

Elasticity. In economic analysis, the sensitivity of the demand or supply of a commodity to changes in another variable (e.g., the price elasticity of gasoline is the ratio of the percent change in consumption to percent change in price).

Elevated Guideway. A guideway that is positioned above the normal activity level (e.g., elevated structure for light rail to cross over a street).

Emission. Particulate, gaseous, noise, or electromagnetic byproducts of the transit system or vehicle.

Emission Control. Method by which emissions are governed in an effort to minimize the pollutants and/or noise emitted.

Emission Inventory. A listing by emission source of the amounts of air pollutants released into the atmosphere (generally, in tons or kilograms per day).

Emission Source. The origin of an air pollutant (e.g., automobiles and trucks are sources of carbon monoxide, hydrocarbons, and nitrogen oxides).

Emission Standards. A limitation on the release of an air contaminant into the ambient air (e.g., the federal government limits carbon monoxide, hydrocarbon, and oxides of nitrogen (NOx) emissions per mile of travel in new automobiles).

Endangered Species. According to the Federal Endangered Species Act of 1973, an endangered species is any species in danger of extinction throughout all or a significant portion of its range, other than an insect determined by the Secretary of the Interior to constitute a pest whose protection under the provisions of this act would present an overwhelming and overriding risk to man.

Energy Factor. A number that when multiplied by the appropriate usage units (e.g., vehicle miles, tons, dollars), yields a measure of energy consumption (e.g., 0.5 gallon per vehicle mile x 10 miles = 5.0 gallons consumed for propulsion).

Energy System. The network of major and minor routes, vehicles, facilities, and other energy-consuming entities that are considered in energy analysis.

Equity. The incidence of fairness and the distribution of benefits, costs, and impacts among population subgroups except as defined for subareas per allocations set out in Sound Move.

Equivalent Level (Leq). Leq is a measure of sound energy over a period of time. It is referred to as the equivalent sound level because it is equivalent to the level of a steady sound which, over a referenced duration and location, has the same A-weighted sound energy as the fluctuating sound.

Express Service. Transit service where a very limited number of stops are made.

Facilities Energy (also, Station Energy). A portion of the operational energy that includes the energy to operate parking lots, administration buildings, and other facilities. It does not include propulsion or maintenance energy.

Facility. The means by which a transportation mode is provided. For example, a sidewalk is a facility for pedestrians as is a highway is a facility for vehicles.

Fare. The authorized amount (cash or token) paid or the valid transfer or pass, presented for a transit ride.

Fare Box. A device that accepts and, in some cases, registers coins and tokens used by passengers as payment for rides.

Fare Structure. The methodology of determining the fare that a passenger pays for service.

Feeder Bus Station. A station that provides lateral bus transportation service for riders to transfer to a light rail mode.

Feeder Service. Local transit service that feeds trunkline (usually faster and at higher capacity) transit service.

Fixed Route. Transit service provided on a repetitive, fixed-schedule basis along a specific route with transit vehicles stopping to pick and deliver passengers to specific locations.

Forest or Woodland Habitat. A habitat type generally dominated by Douglas fir, western red cedar, and western hemlock, frequently with a hardwood understory. The ground cover is generally lush. Birds and small mammals abound, and larger mammals are common in large stands.

Frequency, Vehicle. Time rate of vehicle arrivals at a station stop or along a transit line.

Full Acquisition. A type of property encroachment that would require the acquisition of the full parcel and displace the current use.

General-Purpose Lane. Term to describe a traffic lane on a highway that can be used by all types of vehicles including single occupant autos, carpools, trucks and motorcycles.

Grade Separated. Parallel or crossing lines of traffic that are vertically or horizontally physically separated from each other and do not share a common intersection.

Greenhouse Gases (GHG). Greenhouse gases include CO_2, methane (CH_4), O_3, water vapor, nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These gas emissions are collectively leading to the greenhouse effect, trapping the sun's solar rays and leading to an increase in Earth temperature.

Groundborne Noise. Noise that is transmitted through the ground, typically reported in decibels.

Groundborne Vibration. A small but rapidly fluctuating motion transmitted through the ground, typically reported as velocity or acceleration.

Guideway. Specifically designed way traversed by transit vehicles constrained to the way.

Habitat Function. Terrestrial plant communities, wetlands, and aquatic systems such as streams provide a variety of functions in the environment. For instance, depending on the condition and location of a wetland, wetland functions might include water quality improvement, groundwater recharge, nutrient and sediment filtering, and habitat for a variety of animals, as well as education and recreation opportunities for people—the habitat function is one of several functions potentially performed by wetlands. Similarly, terrestrial and aquatic systems each also may perform many functions. When they provide habitat for animals, they are said to be performing or providing a "habitat function."

Habitat Value. The value of plant community's function as determined by the habitat's ability to support the needs of biological species. High-value habitats are those that support or may support threatened, endangered, and/or sensitive species as determined by the federal, state, and local jurisdictions.

Headway. The headway between vehicles in public transit systems is the amount of time (usually in minutes) that elapses between two vehicles passing the same point traveling in the same direction on a given route.

High-Capacity Transit (HCT). A system of public transportation services within an urbanized region operating principally on exclusive rights-of-way, examples include light rail transit or express buses on exclusive bus ways and their supporting services.

High-Occupancy Vehicle (HOV). Any passenger vehicle that meets or exceeds a certain predetermined minimum number of passengers, for example, more than two or three people per automobile. Typically includes carpools with two or more people, vanpools, and buses.

Hours of Service. The number of hours during the day between the start and end of service on a transit route, also known as the service span.

Hydrocarbon (HC). Nonmethane hydrocarbon that contributes to the formation of photochemical oxidants (commonly known as smog), primarily ozone.

Impedance Value. A factor used to weight the time spent waiting for transit. Often computed as 2.1 times the in-vehicle time.

Indirect Energy. A term used to denote all energy inputs for the construction, operation, and maintenance of a system.

Indirect Source. An entity that does not directly emit pollutants but attracts emission sources such as automobiles and trucks. Shopping centers, stadiums, and highways are examples of indirect sources.

Induced Trips. Trips generated because of the construction of a new (transportation) facility. (Different from Shifted Trips).

Integration with Other Modes. Method by which a transit system interfaces with other modes of transportation.

Interchange. The system of interconnecting ramps between two or more intersecting roadways or guideways that are grade separated.

Interim Terminus. A station where the project would operate until the next portion of the project can be built. The terminus would typically include a station with tail tracks extending beyond the station for layover of trains.

Interslab Subduction Zone. Interslab subduction zone is the zone between the earth's crustal plates. This zone is the source of large earthquakes off the coast of Washington.

Joint Development. Opportunities for the development or redevelopment of adjacent parcels (in station areas) in a manner that would support both the transit investment and the community objectives through the use of both public and private funds.

Kilowatt (kW). A unit of electrical energy.

Kilowatt-hour (kWh). One kilowatt of energy used over one hour.

Key Observation Point (KOP). A view location used to describe existing visual conditions and to analyze

Lacustrine soils. A soil that has been formed in a lake bed.

Land Development Pattern. The use, types, and intensity of development. Land development patterns affect trip demand, average trip length, and therefore, energy consumption.

Landscaped Habitat. A habitat in urban areas having limited native species. Vegetation generally consists of mowed lawns and exotic trees and bushes.

Ldn. The day/night average noise level.

Leq. The equivalent steady-state sound level that, in a specified time period, would contain the same acoustic energy as the varying sound level during the same period; considers volume capacity, travel speeds and delay.

Leq(h). The hourly value of Leq.

Level of Service (LOS). A qualitative measure that represents the collective factors of travel under a particular volume condition. A measure of traffic congestion.

Light Rail Transit (also Light Rail). A mode of mass transportation comprising light rail vehicles, which travel on steel tracks and are powered by electricity from overhead wires. This mode is characterized by its ability to operate in both at-grade and/or grade-separated environments.

Line Source. A general classification of the origin of an air pollutant (e.g., highways and other roads are line sources of carbon monoxide emissions).

Link. Sound Transit's light rail system.

Load Factor. The average ratio of passengers to seats, during some specified period of operation of a public transit route.

Local Service. A type of transit operation involving frequent stops and consequent low speeds, the purpose of which is to deliver and pick up transit passengers as close to their destinations or origins as possible.

Locally Preferred Alternative (LPA). Following the publication of a Draft EIS, the Sound Transit Board identifies a *Preferred Alternative*, consisting of routes and station preferences. This is known as a "locally" *Preferred Alternative* because FTA has not yet selected a *Preferred Alternative*.

Maintenance Area. Maintenance areas are geographic areas with a history of nonattainment of National Ambient Air Quality Standards (NAAQS) but which now consistently meet NAAQS.

Maintenance Energy. A portion of operational energy that is applied to repair and maintenance of vehicles and buildings in the system. It does not include propulsion or facilities energy.

Median Track Alignment. In rail operations, a type of alignment where tracks are positioned in the median on the street, as opposed to being positioned on one side of the street.

Megawatt (MW). 1,000,000 watts.

Microgram per Cubic Meter (μg/m^3). A unit of concentration equal to one thousandth of a gram per cubic meter.

Minimum Operable Segment (MOS). A shorter segment of the project route that could be successfully operated on an interim or long-term basis if necessary, and could be extended at a later time.

Minimum Turn Radius. Generally assumed to be the minimum horizontal turn radius (tightest curve).

Minority Residents. Those persons who, in responding to the 1990 U.S. Census, indicated their race to be something other than "White" or reported entries that the Bureau of the Census categorized as something other than "White."

Mobility. The ease of continuous movement along the transportation system.

Mobility Limited. As defined for 1990 U.S. Census data, persons who had a health condition (physical and/or mental) that had lasted for 6 or more months and which made it difficult to go outside the home alone.

Mode. A particular form or method of travel, such as pedestrian, bicycle, automobile, bus, or light rail.

Mode Share. The percentage of travelers that travel either by SOV, HOV, or transit modes on a given roadway facility.

Mode Split. Forecast of proportion of total person-trips that would use each of the various modes of transportation that include transit and cars.

Model Toxics Control Act (MTCA). The Model Toxics Control Act Cleanup Regulation, WAC 173-340, implements the Model Toxics Control Act, RCW 70.105D, which addresses strict requirements for site discovery and reporting, site assessments, and site remediation. Most important, the regulation defines standard methods used to assess whether a site is contaminated or clean.

Modeled Concentration. An air pollutant level, excluding the background level, predicted by a model (see Background Concentration).

National Ambient Air Quality Standards (NAAQS). Federal limits on levels of atmospheric contamination necessary to protect the public from adverse effects on health (primary standards) and welfare (secondary standards).

National Historic Preservation Act of 1966 (NHRA). The act that established the National Register of Historic Places and State Historic Preservation program and set forth guidelines and regulations for environmental review of projects involving federal funding.

National Register of Historic Places (NRHP). The official list of the nation's cultural resources determined to be worthy of preservation; the register is maintained by the National Park Service.

Network. A system of real or hypothetical interconnecting links that forms the configuration of transit routes and stops which constitute the total system.

Nonattainment Area. An area designated by the EPA as presently violating the National Ambient Air Quality Standards, based on archival air quality data.

NO_X. Oxides of nitrogen (nitrogen oxide and nitrogen dioxide). The pollutants released during high-temperature combustion of fossil fuels such as diesel.

Off-Peak. Those periods of the day when demand for transit service is not at a maximum.

Open Field Habitat. A habitat characterized by various species of perennial and annual grasses, forbs, small and large birds, small mammals, and snakes. This habitat is especially important in providing nesting sites and food for various song and predatory birds.

Operating Costs. Recurring costs incurred in operating transit systems, including wages and salaries, maintenance of facilities and equipment, fuel, supplies, employee benefits, insurance, taxes, and other administrative costs. Amortization of facilities and equipment is not included.

Operating Revenue. The gross income from operation of the transit system including fares, charter income, concessions, advertising, etc. Does not include interest from securities, nonrecurring income from sale of capital assets, etc.

Operational Energy. The energy used for vehicle propulsion, facilities, and maintenance for a specified period, usually one year.

Originating Ride (or Trip). A one-way trip taken on a transit line or group of lines, where a transfer from one line to another is not considered to be the start of a new trip.

Overhead Catenary System (OCS). Electrical transmission poles and lines that supply power to the light rail system.

Ozone. A gas consisting of three oxygen atoms formed in reactions of nonmethane hydrocarbons and nitrogen oxides in the presence of sunlight. Ozone is one of the Criteria Air Pollutants.

Palustrine Wetland. Freshwater wetlands dominated by trees, shrubs, and emergent vegetation.

Park-and-Ride Lot. A lot that provides parking for patrons of a transit facility.

Parking Utilization. The number of parking spaces being utilized at a given location, it is calculated as the total number of parking spaces occupied divided by the total parking supply at a given location.

Partial Acquisition. A property that would be partially acquired in order to build and operate the light rail.

Pasquill Stability Class. A category of atmospheric stability ranging from Class A (extremely unstable conditions) to Class F (moderately stable conditions).

Passenger Load/Passenger Load LOS. The number of passengers on a transit unit (vehicle or train) at a specified point.

Passenger Mile. A measure of travel equivalent to one passenger traveling one mile.

Patronage. The number of person-trips carried by a transit system over a specified time period.

Peak Hour. The hour of the day in which the maximum demand for service is experienced, accommodating the largest number of automobile or transit patrons.

Peak Particle Velocity (PPV). Specifications for allowable levels of vibration from blasting, pile-driving, and other construction processes with the potential of causing building damage are almost always expressed in terms of peak particle velocity since this is thought to be well correlated with maximum stresses in buildings. Peak particle velocity is the instantaneous positive or negative peak in the vibration signal.

Peak Period. A time period or periods when travel activity is at its heaviest.

Pedestrian Level of Service (LOS). An overall measure of walking conditions on a route, path, or facility.

Person Demand. The number of persons that use a specific roadway or highway facility, thus creating a demand for usage of the facility; it is often compared to roadway capacity to determine the level of congestion.

Person Throughput. The amount of persons that can pass a point on a roadway or pass through an intersection over a specified period of time.

Person Trip. A trip from a point of origin to a destination made by a person by any travel mode. Within transit, transfers are not counted. That is, a person traveling from home to work on a bus with one transfer creates only one-person trip.

Photochemical Oxidants (Smog). Gaseous pollutants formed from reactions of non-methane hydrocarbons and nitrogen oxides (NOx) in the presence of sunlight (e.g., ozone).

Platform Hours. Elapsed time from when a transit bus or train pulls out of the garage into service to when it returns to the garage after completing its service.

Point Source. A general classification of the origin of an air or water pollutant, usually characterized as smokestacks or outfalls.

Pollutant-Generating Impervious Surface (PGIS). Impervious surfaces considered to be a significant source of pollutants in stormwater runoff. Such surfaces include those subject to vehicular use, industrial activities (as defined in the Ecology Manual), or storage of erodible or leachable materials, wastes, or chemicals, and which receive direct rainfall or the run-on or blow-in of rainfall.

Polychlorinated Biphenyl (PCB). Hazardous environmental pollutants upon which the federal government has placed additional controls regulating disposal.

Potentially Affected Area. This is defined differently by each technical discipline. It includes the area that could be affected by the alternatives.

Poverty-Level Household. As used for 2000 U.S. Census data, the average poverty threshold for a family of four persons was $17,603 in 2000. The defined family poverty level threshold varied by total number of family members, number of children under 18 years, and number of persons over age 65. For a detailed discussion of the poverty definition, see U.S. Bureau of the Census, *Current Population Reports, Series P-60, No. 171, Poverty in the United States: 1988 and 1989.*

Power. The time rate of energy use.

Preferred Alternative. Following publication of the Draft EIS, the Sound Transit Board identifies a *Preferred Alternative*, including route and station options. The Final EIS further evaluates the *Preferred Alternative* as well as other alternatives.

Propulsion Energy (also, Direct Energy). In transportation analysis, a portion of operational energy that includes fuels and electricity to propel vehicles and provide lighting, heating, and air conditioning within them.

Pulsing. The coordinated arrival and departure of buses on a number of different bus lines at a transit center to facilitate transferring of passengers among those bus lines. Usually, local feeder bus lines are scheduled to arrive at the transit center just ahead of the trunkline bus or train and then depart just after the trunkline bus or train.

Queue. A line of vehicles, bicycles, or persons waiting to be served by the system in which the flow rate from the front of the queue determines the average speed within the queue. Slowly moving vehicles or people joining the rear of the queue are usually considered part of the queue. The internal queue dynamics can involve starts and stops. A faster-moving line of vehicles is often referred to as a moving queue or a platoon.

Radial System. A network of transit lines that meet in the downtown area.

Region. The four-county Puget Sound Regional Council region, including King, Pierce, Snohomish, and Kitsap Counties.

Reliability. How often transit service is provided as promised; affects waiting time, consistency of passenger arrivals from day to day, total trip time, and loading levels.

Representative Alignment. The East Link general alignment that consists of *Preferred Alternative A1*, Alternative B3, Alternative C4A, *Preferred Alternative D2A*, and *Preferred Alternative E2*.

Right-of-Way. The corridor (horizontal and vertical space) owned by the transit agency for the transportation way.

Riparian Habitat. A habitat type associated with stream and lake margins and characterized by dense vegetation consisting primarily of willow, alder, and cottonwood species, supporting a wide variety of waterfowl, songbirds, amphibians, and small mammals.

Route. The course followed by a transit vehicle as a part of the transit system.

Route Miles. The length of a route measured in miles between its end points.

Runoff. The rainwater that directly leaves an area in surface drainage, as opposed to the amount that seeps out as groundwater.

Screenline. A screenline is an imaginary line across a section of freeways or arterials. Screenlines are often used in traffic analyses to determine how much volume is entering or exiting a particular area.

Section 10. Section 10 of the Rivers and Harbors Act of 1899 established authority to issue permits for obstructions or alterations of any navigable waters of the United States. This permit program is administered by the U.S. Army Corps of Engineers.

Section 106. Section 106 of the National Historic Preservation Act of 1966 established a procedure to review the potential effects on cultural resources by projects receiving federal funds.

Section 4(f). Section 4(f) of the Department of Transportation Act restricts the United States Department of Transportation's approval of projects affecting the following properties: publicly owned land from a public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site.

Section 404. Section 404 of the Clean Water Act is a permit program administered by USACE under guidelines by EPA to protect the nation's waters from dredged and fill sources.

Section 6(f). Section 6(f) of the Land and Water Conservation Act of 1965 established restrictions on, and replacement requirements for, the use of land acquired with funds authorized under the Land and Water Conservation Fund Act.

Section 9. Section 9 of the Rivers and Harbors Act of 1899, established authority to issue permits for bridges and causeways across any navigable waters of the United States – Section 9 Permits are administered by the U.S. Coast Guard.

Segment. This refers to the five sections of the East Link Project, as defined in Chapter 2 of the Final EIS.

Sensitive Receptor (Auditory). A local area or site that supports activities easily disrupted by audio intrusions or distractions, such as a park, school, historic landmark, or residential neighborhood.

Sensitive View. A view that is identified by local jurisdictions as requiring protection.

Sensitivity Analysis. A "what-if" type of analysis to determine the sensitivity of the outcomes to changes in parameters; if a small change in a parameter results in relatively large changes in the outcomes, the outcomes are said to be sensitive to that parameter.

Service Frequency/Frequency. The number of transit units (vehicles or trains) on a given route or line, moving in the same direction, that pass a given point within a specified interval of time, usually 1 hour.

Side-Track Alignment. In rail operations, a type of alignment where the tracks are positioned on one side of the street, as opposed to being positioned in the median of the street.

Signal Phasing. A group of three traffic signal timed intervals (green, yellow, red) that are assigned to an independent traffic movement or combination of movements.

Signal Preemption. Traffic signal options that may modify normal traffic signal phasing for preferential treatment of transit vehicles.

Signal Progression. A series of traffic signals timed and coordinated to optimize the flow of selected traffic movements.

Smog. See Photochemical Oxidants.

Social Interaction. Intra-neighborhood communication and circulation using street, sidewalk, and bikeway connections between residential areas and community facilities, retail businesses, and employment centers. Also includes verbal interaction and telecommunications facilities.

Sounder. Sound Transit's commuter rail system, which travels from Everett to Lakewood, through Seattle.

Sound Transit 2 (ST2). A package of HCT investments in the regional transit system, adopted in May 2007, which included light rail as the mode choice for the East Corridor on I-90.

Staging Area. Section of land near a construction site designated for equipment and truck storage, maintenance, and warm up prior to engagement in construction activities.

State Implementation Plan (SIP). A plan required of each state by the Clean Air Act that describes how the state will attain and maintain the National Ambient Air Quality Standards.

Stormwater Detention. The temporary storage of stormwater runoff and subsequent release at a slower rate.

Stormwater Treatment. Stormwater ponds and underground vaults are used to remove sediments and dissolved metals from stormwater. They collect sediments on the bottom of the pond or vault, where maintenance workers can clean them out on a regular basis.

Straddle Bent. Light rail guideway support that extends across the width of the street.

Subarea. A unique portion of the Regional Transit Authority taxing district, one of five as defined in Sound Move (Snohomish County, North King County, East King County, South King County, and Pierce County).

Subduction Zone. An area where one crustal plate is descending below another. The Puget Sound area is close to a subduction zone, which is formed by the Juan de Fuca plate descending below the North American plate. This action can cause significant seismic activity.

Terminal. The terminating point of transportation routes with transfer facilities and, often, amenities for passenger convenience.

Terminus. A transit station located at the end of a transit (including light rail) line.

Threatened Species. According to the Federal Endangered Species Act of 1973, any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

Through Route. Interconnected transit lines in the downtown area, or a transit center, that allow buses (or trains) entering downtown or the transit center on one line to pass through and exit on another line. This eliminates the need to turn transit vehicles around downtown or at the transit center and allows some passengers to continue without transferring.

Title 23, Code of Federal Regulations, Part 771 (23 CFR Part 771) (Revised 1987). Federal Highway Administration and Federal Transit Administration regulations governing the preparation of environmental impact statements and related documents.

Title 23, Code of Federal Regulations, Part 777 (23 CFR Part 777) (Revised 1980). Federal Highway Administration (FHWA) and FTA regulations providing policy and procedures for evaluation and mitigation for impacted, privately owned wetlands.

Total Maximum Daily Loads (TMDL). For 303(d)-listed water bodies, TMDLs are developed by Ecology for the pollutants that exceed water quality standards as a means for ultimately attaining the standards.

Total Suspended Particulates (TSP). Air pollutants that consist of solid particles (dust, lead, salts, etc.) suspended in the atmosphere. TSP is a criteria air pollutant.

Total Suspended Solids (TSS). Organic and inorganic particles that are entrained within and carried by water. The particles are typically sand, silt, and clay, but may include pebbles and larger rocks in fast-flowing water.

Total Travel Time. The total elapsed time between trip beginning and end, including travel, terminal, and waiting time.

Traction Power Substation. Electrical station that provides the power needed to drive the trains. The substations are housed in either standalone structures, or within transit stations, typically within or adjacent to the right-of-way. The substations would typically be built about one and a half miles apart.

Transfer Ratio. The number of boarding trips divided by originating trips.

Transfer Time. The elapsed trip time required to change between modes (e.g., bus to light rail) or to transfer between routes of the same mode (e.g., bus to bus).

Transfer. The portion of a trip between two connecting transit lines, both of which are used for completion of the trip.

Transit. A transportation system principally for moving people in an urban area and made available to the public usually through paying a fare.

Transit Center. A station with shelters where a large number of transit vehicles and passengers can be brought together with safety and convenience.

Transit-Oriented Development. The Transportation Research Board provides several definitions of transit-oriented development that emphasize high-quality walking environments, mixed land uses, and high-density developments linked to transit. Generally, transit agencies agree that what constitutes a transit-oriented development is a pattern of dense, diverse, pedestrian-friendly land uses, near transit nodes that, under the right conditions, translates into higher transit patronage.

Transit Service Reliability. Reliability is defined as the degree to which transit service can be counted on for consistent, on-time performance.

Transit Street Classification System. The City of Seattle's system for designating certain streets as being important for transit. This is part of the city's overall street classification system.

Transportation Corridor (also, Corridor). The group of travel movements (or travel flows) between two or more locations. A corridor might have components or subcorridors. A corridor includes all facilities, transit and highway, that might be used to accommodate the specified travel movement.

Transportation Systems Management (TSM). Incorporates relatively low-cost approaches to improving mobility without constructing major new transportation facilities. TSM generally emphasizes smaller physical improvements and operational changes such as intersection improvements, minor widenings, traffic engineering actions, operational changes such as queue jumps or queue bypass lanes for buses, expanded bus service, transit centers, and improved transit access.

Travel Time (in vehicle). The time required to travel between two points, not including terminal or waiting time.

Trip. The one-way movement of one person between his origin and his destination, including transfers and the walk to and from the means of transportation.

Trip Demand. The number and type (public or private origin and destination) of trips measured, calculated, or forecasted in a specified area having a given land development pattern. Trip demand also depends on prevailing economic, behavioral, and attitudinal conditions.

Trip Length. The number of miles per trip. This is usually an average number for a specified trip type, area and analysis year.

Turn Pocket. Term used to describe a traffic lane that separates turning vehicles from thru lanes. For example, a left-turn pocket is also commonly known as a left-turn lane.

Unity. In visual analysis, the visual coherence and compositional harmony of the landscape.

Use of Section 4(f) Land. According to regulations of the U.S. Department of Transportation, use of Section 4(f) land is defined as: (1) acquisition of title or easement to land, or (2) in unusual circumstances, serious indirect impacts, such as increase in noise, visual intrusion, or access obstruction.

Vehicle Hours Traveled (VHT). The total vehicle hours expended traveling on the roadway network in a specified area during a specified time period.

Vehicle Mile. An amount of travel equivalent to one vehicle traveling one mile.

Vehicle Miles Traveled (VMT). The total number of vehicle miles traveled within a specific geographic area over a given period of time.

Vehicle Occupancy. The number of persons per vehicle. Usually an average number for a specified trip type, area, and analysis year.

Vehicle Throughput. The number of vehicles, usually on a highway, that get through a screenline over a short time period such as an hour.

Vent (also Remote Vent). Vent structures provide emergency ventilation and access for tunnel sections, and are often located adjacent to station entrances. Vents that are not adjacent to the station are called "remote vents." Surface vent buildings enclose the vent and include an exhaust and intake in the roof, a fan room, and space for electrical and communications equipment.

Vibration Propagation. The transfer of vibration through soil or other media.

Vibration Propagation Test. A test that provides an estimate of vibration levels as a function of distance from a vibration source, in this case the light rail vehicle. Tests are done on the surface to evaluate propagation at-grade, or at the bottom of a bore hole for tunnel routes.

Vibration Velocity. Vibration velocity is the basic measure of ground-borne vibration. It is a measure of the rate at which particles in the ground are oscillating relative to the equilibrium point.

Vibration Velocity Level. It is generally accepted that, over the frequency range important for ground-borne vibration from transit systems, human response to vibration is best correlated to the root-mean square (rms) vibration velocity. In this report, rms vibration velocity is always expressed as decibels relative to 1 micro-inch per second.

Viewer Sensitivity: The extent of the viewer's concern for a particular view or viewshed. Viewer sensitivity to the viewed environment is classified as low, average, or high.

Visual Amenity. An object or element (such as buildings or vegetation) that enhances the visual character of a view or area.

Visual Character. Visual character is an impartial description of the landscape in terms of dominance, scale, diversity, and continuity. Visual character-defining environments and features include landforms, vegetation, land uses, transportation facilities, overhead utilities, open spaces, water bodies, designated viewpoints, and views to the visual environment.

Visual Encroachment. The imposition of an object, or objects, on a view such that the view is disrupted, obstructed, or otherwise modified from its original state.

Visual Quality. Visual quality is an assessment of the visual character and is categorized as low, medium, or high, as follows:

- **Low Visual Quality.** Areas that have low visual quality may have features that seem visually out of place, lack visual coherence, do not have compositional harmony, and contain eyesores.
- **Medium Visual Quality**. These areas can be generally pleasant appearing, but may lack distinctiveness, memorability, drama, and compositional harmony, or may simply be very common and ordinary landscapes.
- **High Visual Quality.** These areas may be memorable, distinctive, unique (in a positive way), intact natural or park-like areas or urban areas with strong and consistent architectural and urban design features.

Volume to Capacity (v/c) Ratio. The ratio of demand flow rate to capacity for a highway or arterial facility; a v/c ratio below 1.0 means that traffic volumes are below the capacity of the roadway, when identified as greater than 1.0, the traffic volume has theoretically exceeded the carrying capacity of the roadway.

Washington State Department of Ecology 303(d) List. The federal Clean Water Act (CWA), adopted in 1972, requires states to restore their waters to be "fishable and swimmable." The CWA established a process to identify and clean up polluted waters. Every 2 years, all states are required to prepare a list of water bodies that do not meet water quality standards. This list is called the 303(d) list because the process is described in Section 303(d) of the CWA.

Appendix B

Public Involvement and Agency Coordination

Appendix B

Public Involvement and Agency Coordination

The National Environmental Policy Act (NEPA), the Washington State Environmental Policy Act (SEPA), and the Safe, Accountable, Flexible, and Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) emphasize the importance of agency cooperation early in the environmental review process. Sound Transit is committed to early agency involvement and cooperation, and it has worked with local public transportation agencies and local jurisdictions and state and federal agencies to create an open public involvement process with ample opportunities to inform and involve the public. Consistent with SAFETEA-LU, Sound Transit drafted a Coordination Plan and sent it to potentially interested agencies for review and comment during the environmental impact statement (EIS) public scoping period. The Coordination Plan is available for review on Sound Transit's project website (www.soundtransit.org/eastlink), or hard copies can be obtained at Sound Transit offices (see the Fact Sheet on page iii of this Final EIS for information). This appendix summarizes these plans and outlines the goals, objectives, and implementation of extensive public and agency outreach activities.

B.1 Outreach Goals and Objectives

Citizens and groups have had numerous opportunities to interact with, and receive a response from, Sound Transit on issues of interest or concern in the development and evaluation of the East Link Project. Sound Transit has established the following goals and objectives to guide the process:

- Inform the public of the project's purpose and need and identify the process and schedule for public participation.
- Inform the public of the project's EIS availability and identify the process and schedule for public participation.
- Involve the community, and actively seek out a variety of viewpoints, taking into consideration these viewpoints at all stages of planning, development, and engineering.
- Consider, answer, and account for public inquiries, suggestions, and ideas in the decision-making process.
- Provide opportunities for the public to influence major decisions before they are finalized.
- Publicize programs and activities through a variety of communication vehicles to accommodate the diverse communities within the project vicinity, meet environmental justice requirements and limited English proficiency needs, and make the proceedings and records available for public review.
- Provide the public with different opportunities for, and methods of, accessing project information throughout each project phase.
- Engage diverse populations early in the planning and development process by making materials available in multiple formats and holding meetings in accessible facilities.

This appendix summarizes agency coordination and public outreach activities performed throughout the environmental review process, up to the issuance of this Final EIS.

B.2 Agency Coordination

Consistent with the Coordination Plan, Sound Transit has been coordinating periodic interagency meetings and other activities to collect input from interested agencies. These meetings and activities were designed to obtain suggestions regarding the development of project alternatives and regarding resource analysis methodologies prior to beginning analyses and during other key project milestones, such as during the NEPA/SEPA scoping process. Three categories of interagency participation were established to facilitate agency cooperation and input for the East Link Project: co-lead, cooperating, and participating agencies. At the beginning of the environmental review process, prior to scoping, Sound Transit invited agencies to participate, where appropriate, in these categories, as described in the following subsections. Agency correspondence received to date is located in corresponding sections:

- Documentation of coordination with cooperating agencies on 4(f) park impacts is located in Appendix D: Section 4(f)/6(f) Evaluation of this Final EIS, including documentation that the I-90 bike trail is a transportation network, not a 4(f) resource.
- Correspondence between the Federal Transit Administration (FTA) and State Historic Preservation Office on the presence and eligibility of cultural resources for the National Register of Historic Preservation; and between Sound Transit and local jurisdictions on the eligibility of historic resources for local landmark status; and correspondence with local tribes on culturally sensitive resources are all located in the *Historical and Archaeological Resources Technical Report* (Appendix H4, bound separately from this Final EIS).
- Appendix J, *East Link Project Final Environmental Impact Statement Public and Agency Comments and Responses on the Supplemental Draft Environmental Impact Statement,* includes all agency, business, and individual comments received on both documents, as well as Sound Transit's responses to each.

B.2.1 Lead Agency

The FTA is the federal lead agency for NEPA purposes, supervising the preparation of the EIS by Sound Transit. Sound Transit is the nominal lead agency for SEPA purposes. The Washington State Department of Transportation (WSDOT) is a co-lead agency for SEPA because the project alternatives are within or adjacent to WSDOT facilities and rights-of-way. These agencies are responsible for making information available to the cooperating and participating agencies as early as practicable in the environmental review process (SAFETEA-LU Section 6002; Section 139(h)(2-3)).

B.2.2 Cooperating Agencies

Cooperating agencies are any other federal, state, and local public agencies with jurisdiction or special expertise with respect to any environmental issues that should be addressed throughout the NEPA process. Sound Transit invited such agencies to serve as cooperating agencies, which includes responsibility for developing information, preparing environmental analyses, and making available staff to support and enhance the lead agency's interdisciplinary capability. To date, the following agencies have accepted their status as cooperating agencies:

- Federal Highway Administration (FHWA)
- Cities of Seattle, Mercer Island, Bellevue, and Redmond
- King County
- U.S. Army Corps of Engineers (USACE)
- U.S. Coast Guard (USCG)

B.2.3 Participating Agencies

Participating agencies, according to SAFETEA-LU Section 6002: Section 139(d), are the federal and nonfederal agencies that may have an interest in the project. The following agencies were invited to participate in the environmental review process:

- U.S. Department of the Interior (DOI)
- U.S. Department of the Interior, National Park Service (NPS)
- U.S. Fish and Wildlife Service (USFWS)
- U.S. Environmental Protection Agency (EPA)
- Advisory Council on Historic Preservation (ACHP)
- Bureau of Indian Affairs (BIA)
- Federal Emergency Management Agency (FEMA)
- National Marine Fisheries Service (NMFS)
- Washington Department of Archaeology and Historic Preservation (DAHP)
- Washington Department of Natural Resources (WDNR)
- Washington Department of Fish and Wildlife (WDFW)
- Washington State Department of Ecology (Ecology)
- Puget Sound Clean Air Agency (PSCAA)
- Puget Sound Regional Council (PSRC)
- City of Clyde Hill
- City of Kirkland
- City of Issaquah
- Town of Beaux Arts
- City of Medina

Sound Transit staff contacted the Washington Department of Archaeology and Historic Preservation and the BIA to determine which tribes have interests in the project vicinity and should be included as affected agencies. The project vicinity does not include any tribal lands, but the tribes are expected to have interests regarding natural and cultural resources. Therefore, because of the government-to-government consultation responsibilities associated with tribes, FTA initiated consultation with these tribes and invited them to become participating agencies. The following tribes have been contacted via letter, telephone conversations, and as needed, in-person meetings:

- Muckleshoot Tribe
- Snoqualmie Tribe

- Suquamish Tribe
- Tulalip Tribe
- Yakama Tribe
- Duwamish Tribe (not federally recognized)

FTA, Sound Transit, and WSDOT continue to consult with the tribes regarding potential natural and cultural resource impacts of concern on the tribes throughout project development.

B.2.4 Resources by Agency

Federal, state, and local agencies have been helpful in providing data collection, resource identification, determination of regulatory compliance requirements, and/or development of resource methodology. Table B-1 lists the resource information Sound Transit gathered, in order by agency. Agencies also provided additional information and evaluation throughout the analysis process, which is ongoing through the completion of this Final EIS.

TABLE B-1
List of Resources Provided by Agency

Agency	Resources Provided
Federal	
U.S. Army Corps of Engineers	Wetlands, waters of the U.S.
Federal Highway Administration	Traffic; highway improvement plans; utilities
Federal Emergency Management Agency	Flooding
U.S. Department of Interior, Geology Survey	Geology and soils
U.S. Environmental Protection Agency	Hazardous materials
U.S. Fish and Wildlife Service	Threatened and endangered species, Essential Fish Habitat
U.S. Coast Guard	Navigation
National Marine Fisheries Service	Threatened and endangered species
Advisory Council on Historic Preservation	Historic and archaeological resources
State	
Recreation and Conservation Office	Parklands and land and water conservation-funded resources
Department of Fish and Wildlife	Threatened and endangered species, fish and wildlife, wetlands
Department of Ecology	Hazardous materials, geology and soils
Department of Natural Resources	Threatened and endangered species, geology and soils
Department of Archaeology and Historic Preservation	Archaeology and historic resources
Local/Regional Agencies	
King County, Cities of Seattle, Mercer Island, Bellevue, Redmond	Land use and economic activity; neighborhoods and population; transportation plans, traffic; archaeology and historic resources; wetlands, water quality, acquisitions, displacements and relocations; noise and vibration; visual and aesthetic resources; parklands; geology and soils; utilities
Puget Sound Clean Air Agency	Air quality
Puget Sound Regional Council	Regional travel; land use and economic activity; population and employment growth projections
Seattle City Light, Puget Sound Energy	Energy, utilities
Tribes (listed in Section B.2.3)	Cultural resources, fisheries

B.3 Outreach Activities and Tools

Agency and public outreach efforts for the East Link Project began in August 2006, with varied and broad-reaching outreach methods. Sound Transit has actively worked to reach agencies, as well as local and regional members of the public, by hosting public meetings and workshops, speaking at open forums, attending community events, and providing briefings and being available to discuss the project with business, neighborhood, and transportation interest groups.

Sound Transit is also targeting outreach efforts to minority and low- income groups by reaching out to associated service providers and community groups where possible. All of Sound Transit's notices and literature for the East Link Project have language blocks stating, "To speak with Sound Transit about the proposed Link light rail mass transit project in East King County, call 1-800-823-9230 during regular business hours," translated into seven languages (Russian, Chinese Mandarin, Spanish, Vietnamese, Korean, Hindi, and Japanese). These languages were selected based on 2000 U.S. Census data for the project corridor and updated in 2008 and 2010 based on community input. When the Sound Transit staff is contacted by a member of the public who has limited use of English, they have available an immediate phone translation service that provides over-the-phone interpretation in 150 languages, 24 hours a day and 7 days a week. Sound Transit also offers to translate East Link Project fact sheets and related information upon request, as well as provide articles for newsletters, websites, or other communication tools used by service providers and community groups. More information on outreach and impacts on minority and low-income persons is available in Appendix C, Environmental Justice. Table B-2 demonstrates the tools being used for each of the environmental review process milestones.

To make information about the East Link Project as widely available as possible, Sound Transit created and is continually updating a variety of communication tools and materials. These include the maintenance of a website, fact sheets, press releases, and email alerts. These materials and tools provide updated information on the East Link Project and let community members know where and how to provide feedback.

TABLE B-2
Outreach Tools Used for East Link Project

Season Year	Environmental Review Process Milestone	Briefings	Public Meetings	Public Hearing	Mailings	Fact Sheets/ Handouts	Community Events	Comment Database	Web Page	News Media
Summer 2006	Preliminary stakeholder meetings and community briefings	✓				✓	✓	✓		
Summer/ fall 2006	NEPA EIS scoping and comment on project Purpose and Need and alternatives	✓	✓		✓	✓	✓	✓	✓	✓
2007	Alternative development	✓	✓		✓	✓	✓	✓	✓	✓
2008	Draft EIS publication	✓	✓	✓	✓	✓	✓	✓	✓	✓
2010	SDEIS	✓	✓	✓	✓	✓	✓	✓	✓	✓
2011	Final EIS publication	✓			✓	✓	✓	✓	✓	✓
2011	Record of Decision	✓			✓	✓	✓	✓	✓	✓

B.3.1 Database

Sound Transit maintains a database listing people interested in receiving regular mailings on the agency's progress and interested in having opportunities for public input. The database is used when preparing mailings, in addition to the postal carrier routes or addresses within the vicinity of the proposed alternatives, and includes attendees at project open houses and public meetings, correspondents and commenters, and others who have requested information on the East Link Project.

The Sound Transit update list for the East Link Project contains approximately 6,500 email and/or physical addresses. Individuals can request updates through mail or email.

B.3.2 Briefings

Sound Transit actively sought to provide briefings to neighborhood associations, organizations, and businesses in the vicinity of the proposed alternatives by providing project information and answering questions. The primary purpose of these briefings was to allow the project staff to reach members of the public at their own neighborhood, civic, or business meetings. Briefings typically included presentations to civic, business, neighborhood and other interested groups. In some instances, project staff met one-on-one to brief individual stakeholders, provide information, and obtain input. A full list of community briefings that have been held since the environmental review process began can be found in Table B-4 at the end of this appendix. In addition, Sound Transit provided jurisdictional briefings to elected officials and staff in the Cities of Seattle, Bellevue, Mercer Island, and Redmond.

B.3.3 Public Meetings, Open Houses, and Workshops

Sound Transit held public open houses, workshops, and public meetings as the project progressed from scoping through the Supplemental Draft EIS (SDEIS) to share information, answer questions, and obtain input. In addition, Sound Transit has participated in open houses and public meetings organized by other local jurisdictions or projects. Typically, the format included time for the public to view project information and to speak with project team members about the project alternatives.

B.3.4 Public Hearings

A public hearing is required during a typical 45-day Draft EIS comment period. Sound Transit held an extended 75-day comment period with five public hearings. A public hearing was also held during the comment period for the SDEIS. Responses to comments from this and from the SDEIS comment period (held from November 12, 2010, to January 10, 2011) can be found in Appendix J of this Final EIS.

B.3.5 Fact Sheets and Brochures

Fact sheets and brochures for the East Link Project have been developed for distribution at public meetings and workshops, as well as for distribution at community events. The fact sheets and brochures describe the status of the East Link Project, the alternatives being studied for the environmental analysis, and whom community members can contact for more information or with comments.

B.3.6 Community Events

The Sound Transit project staff attends a variety of community events planned by other organizations in order to reach a broader group of community members who might not otherwise seek out information on the project. Sound Transit's presence at these community events has given people the opportunity to pick up information, sign up on the project mailing/email list, and talk with project staff members. Examples of the community events Sound Transit has attended include:

- Crossroads Farmers Market
- Bellevue Strawberry Festival
- Redmond Derby Days
- Mercer Island Summer Celebration
- Bellevue Live at Lunch
- Lake Hills Blueberry Festival
- Mostly Music in the Park
- Bellevue Festival of the Arts
- Redmond Greater Transportation Management Association EcoCommunity Fair

B.3.7 Project Website

Sound Transit developed a website (www.soundtransit.org/eastlink) that provides information on the East Link Project. Individuals can also sign up online for Sound Transit's free email subscription service to receive email updates on the East Link Project.

The East Link website includes an overview of the project, project maps and images, conceptual animations of the project alternatives, and links to frequently asked questions. The project website also contains a document library with links to a variety of project-related documents. These documents are arranged as:

- General project information materials

- Environmental and technical documents
- Public outreach documents
- Presentations to the Sound Transit Board and Board Actions

B.3.8 News Media

The project team has used local newspapers to inform, educate, and involve the public in the East Link Project. Area newspapers in Seattle, Mercer Island, Bellevue, and Redmond have received news releases. Additionally, Sound Transit has advertised public meetings in the local publications.

B.3.9 Affected Property Notification

Concurrent with publication of the Draft EIS in December 2008, Sound Transit mailed letters to 1,185 property owners, notifying them of the Draft EIS availability and the fact that their property could be potentially affected by the East Link alternatives. Sound Transit sent similar letters to 720 potentially affected property owners in November 2010 at the time the SDEIS was published. Concurrent with publication of this Final EIS, letters were sent to the property owners of properties identified in Appendix G2 that may need to be partially or fully acquired to construct the project.

B.4 Outreach Steps in EIS Process

Public input to the East Link Project is an essential element of the alternatives development, environmental analysis, documentation, and review process, as diagrammed above. As described in the preceding section, Sound Transit has used a variety of methods to reach out to the public, including briefings, open houses, workshops, and public meetings. The NEPA process encourages lead agencies to make diligent efforts to involve the public in preparing and implementing NEPA procedures that involve decisions that would affect the community. This includes providing public notice of public hearings, holding public meetings, and making environmental documents available. Sound Transit's outreach and coordination efforts for the preparation of the EIS are described in the following sections.

B.4.1 Agency Involvement

Sound Transit received early and continuous information and guidance from many agencies throughout the East Link Project environmental process. Consistent with the Coordination Plan (February 2007), Sound Transit has orchestrated periodic interagency meetings and coordination activities to collect input from interested agencies. Prior to beginning analyses and during other key project milestones, initial meetings and activities were designed to obtain suggestions regarding the development of project alternatives and about resource analysis methodologies.

B.4.2 Notice of Intent and Scoping

As required by SAFETEA-LU Section 6002: Section 139(e) and by the NEPA/SEPA regulations, Sound Transit initiated the NEPA process by publishing a Notice of Intent (NOI) in the *Federal Register* on August 22, 2006. A determination of significance was issued on the SEPA register on September 1, 2006. The NOI informed the public that Sound Transit would prepare an EIS for the proposed East Link Project and formally announced the beginning of the scoping process and solicited input on the preliminary Purpose and Need of the project. The NOI described the project and its termini, length, and the general location of the alternatives Sound Transit was considering; provided information on the issues and potential impacts; anticipated federal approvals required; and invited comments, questions, and suggestions on the scope of the EIS.

The purpose of scoping was to share information about the public process, environmental resources, and potential alternatives with the public and agencies within the East Link Project vicinity. During the scoping phase of the project, Sound Transit sought community input on which routes and stations to study, the environmental resources to be evaluated, and the project's preliminary Purpose and Need statement. The public and agencies were asked to identify areas of concern, opportunities, and stakeholder interests to be addressed in the EIS.

During the 30-day scoping comment period, Sound Transit hosted four public scoping meetings and one scoping meeting for agencies and tribes. This series of public scoping meetings took place in Seattle, Mercer Island, Bellevue, and Redmond. Both oral and written comments were accepted at these scoping meetings. In addition, the public submitted comments directly by mail and email. Table B-3 lists the scoping meeting dates and locations.

Sound Transit performed the following outreach and communication activities to inform the public and obtain input during the scoping process:

- Identified alternatives and environmental resources for evaluation.
- Prepared and distributed a scoping information report prior to the start of the 30-day scoping period to provide a general understanding of the project to affected agencies. This Environmental Scoping Information Report, distributed on September 1, 2006, described the preliminary Purpose and Need statement, project planning history, proposed project alternatives, and environmental resources to be evaluated in the EIS, and the project schedule and public involvement process. The report was available at the public open houses, at the agency scoping meeting, and on the Sound Transit website for the public's review and input.
- Sent postcards to more than 150,000 residents and businesses announcing the beginning of the scoping process, the public meetings, and the availability of the Environmental Scoping Information Report.
- Held four well-attended public scoping meetings (see dates in Table B-3) to present and receive comments to help refine proposed alternatives, environmental issues, and the environmental process.
- Held one agency scoping meeting to receive comments from interested and affected agencies.
- Contacted cooperating and participating agencies and invited them to an agency scoping meeting on September 12, 2006, at which Sound Transit sought agency involvement regarding project Purpose and Need, and the range of alternatives, impacts, and important issues to be considered.
- Met or corresponded with affected local, regional, state, and federal agencies; tribes; and other organizations about issues within their jurisdiction or concern.
- Reviewed approximately 300 written and oral comments made at the scoping meetings or received during the scoping period and, as appropriate, refined the proposed alternatives, issues, and public involvement program.
- Summarized the scoping comments in an East Link EIS Scoping Summary Report (October 2006). This report is readily available to the public on the project website at www.soundtransit.org/eastlink.

B.4.3 Development of Alternatives

Following the public scoping process, the Sound Transit Board identified the alternatives to be evaluated in the EIS at its December 14, 2006, meeting. In early 2007, Sound Transit hosted several community-focused workshops to engage community members in refining the route and station alternatives. Following the issuance of the Draft EIS, Sound Transit again worked with the Cities of Bellevue and Redmond and community members to refine existing alternatives and develop additional alternatives, which were then evaluated in an SDEIS.

TABLE B-3
East Link Project Scoping Meetings

Date	Location	Type of meeting
Tuesday, September 12, 2006	Bellevue City Hall, Bellevue, WA	Agency scoping meeting
Wednesday, September 13, 2006	Meydenbauer Center, Bellevue, WA	Public scoping open house
Thursday, September 14, 2006	Old Redmond Schoolhouse Community Center, Redmond, WA	Public scoping open house
Wednesday, September 20, 2006	Union Station, Seattle, WA	Public scoping open house
Thursday, September 21, 2006	Great Hall Community Center at Mercer View, Mercer Island, WA	Public scoping open house

Efforts included asking about important neighborhood features, known resources, and other elements for consideration. Workshop summaries and input received is posted on the project website at www.soundtransit.org/eastlink. The following provides more detail about the associated outreach efforts at the Draft and SDEIS phases.

B.4.4 Draft EIS

The East Link Project Draft EIS described, analyzed, and compared the potential environmental impacts of the alternatives and their implementation, and provided additional information on the methodologies and assumptions used for the analyses. Prior to the issuance of the Draft EIS to the public, cooperating agencies received a preliminary Draft EIS for review and comment. Sound Transit worked with FTA and WSDOT to address the cooperating agency comments on the preliminary draft. The Draft EIS was issued by FTA, Sound Transit, and WSDOT. In addition to the required distribution of the document to federal, state, and local agencies and parties of interest, it was also released to the public with a Notice of Availability (NOA) published in the *Federal Register* and notice in the SEPA register. The following approaches were also used to notify the public about the Final EIS availability and public process:

- Public notices placed in local newspapers
- Announcements of public hearings sent to carrier routes of addresses one-half mile from the proposed alternatives and individuals in the project database
- Email notification sent to project database
- Notice posted on the Sound Transit website and the project-specific website at www.soundtransit.org/eastlink.

In accordance with recent FTA policy, the Executive Summary and a compact disc (CD) of the complete Draft EIS was distributed to the list of recipients (Appendix A3), and a paper copy was available on request. The Draft EIS documents were available to the public as described on the Fact Sheet and at public meetings. An electronic copy of the Draft EIS was also posted on the Sound Transit website. The Draft EIS was circulated to interested parties and agencies for public comment. The public comment period began upon publication of the NOA for the Draft EIS in the *Federal Register*.

Public hearings were held throughout the project vicinity to formally present the Draft EIS findings, including alternatives development and associated environmental impacts, for public comment. The hearings consisted of an open house where project team members were on hand to answer questions and talk to the public, and a court reporter documented the formal hearing. Comments were accepted in writing, transcribed by a court reporter, or through email. The dates and location of these hearings were:

Wednesday, January 21, 2009
Old Redmond Schoolhouse Community Center, 16600 NE 80th Street, Redmond, WA

Thursday, January 22, 2009
Thurgood Marshall Elementary School, 2401 South Irving Street, Seattle, WA

Tuesday, January 27, 2009
Community Center at Mercer View, 8236 SE 24th Street, Mercer Island, WA

Wednesday, January 28, 2009
Bellevue High School, 10416 Wolverine Way, Bellevue, WA

Thursday, January 29, 2009
Bellevue City Hall, 450 110th Avenue NE, Bellevue, WA

B.4.5 Supplemental Draft EIS

In response to comments received during the Draft EIS, Sound Transit initiated several collaborative processes with Bellevue and Redmond City staff and community members. Three specific studies followed the publication of the Draft EIS: the *Downtown Bellevue Light Rail Alternatives Concept Design Report* (February 2010), the *112th Avenue Design Options Concept Design Report* (June 2010), and the *Evaluation of Hospital Station Options* (June 2010). In addition to these studies, Sound Transit coordinated with City of Redmond and community stakeholders about changes in Segments D and E, which are reflected in the Final EIS alternatives for those segments. The outcome of these studies was the publication of an SDEIS to offer the community an opportunity to comment on the new alternatives developed through the studies described below.

B.4.5.1 Downtown Bellevue Light Rail Alternatives Concept Design Report

After the 2008 Draft EIS was published, the City of Bellevue and Sound Transit undertook a coordinated process to identify an alternative that balanced the City’s desire to construct a grade-separated route through Downtown Bellevue and Sound Transit’s need to manage cost and construction risk. The process began with a workshop between the City and Sound Transit staffs to identify criteria and measures as well as a range of alternatives. This range of alternatives was shared with the Sound Transit Board of Directors and the Bellevue City Council before the staff began the evaluation process. At the conclusion of this process, the Sound Transit Board of Directors directed the staff to evaluate six alternatives.

In December 2009 and January 2010, staff members from Sound Transit and the City of Bellevue, supported by the consultant team, evaluated 6 alternatives based on 12 criteria grouped into 8 criteria categories. The criteria included cost estimates, ridership range, traffic operations, environmental impacts, construction risk, and consistency with Bellevue plans. Specific environmental evaluation included displacements, noise and vibration, park, ecosystem, and construction impacts. The evaluation of alternatives was summarized in the *Downtown Bellevue Light Rail Alternatives Concept Design Report*, which was published in February 2010. This report included conceptual illustrations of each alternative.

In February 2010, the Bellevue City Council and Sound Transit Board of Directors met to review the evaluation of alternatives and confirm their shared goals to maintain the project schedule and budget to and meet community needs. In addition to coordination among the city and agency staffs and officials, Sound Transit hosted an open house on February 18, 2010, with 168 attendees and briefed a variety of community groups, including the Bellevue Downtown Association, the Bellevue Chamber of Commerce, the Bellevue Hospital District (Overlake Hospital Medical Center, Children's Hospital, and Group Health Cooperative), the Meydenbauer Convention Center, Microsoft, the Bellevue Club, and the Redmond Chamber of Commerce.

Comments taken from the open house and community briefings were summarized in the *Downtown Bellevue Open House Summary* (February 2010). This report and its appendices are available to the public on the project website at www.soundtransit.org/eastlink.

Following review of the *Downtown Bellevue Light Rail Alternatives Concept Design Report*, coordination with the City of Bellevue, and consideration of public comments, the Sound Transit Board of Directors directed its staff to study four new downtown alternatives in the EIS process on April 22, 2010. These alternatives are included in the SDEIS and this Final EIS.

B.4.5.2 112th Avenue Design Options Concept Design Report

Sound Transit hosted a value engineering study for the East Link Project. The study recommendations included an at-grade alternative using 112th Avenue SE from the "Y" at Bellevue Way to Main Street in Downtown Bellevue. To identify the alternatives on 112th Avenue that best balanced cost, impacts, and benefits, Sound Transit initiated an alternatives evaluation process that resulted in the *112th Avenue Light Rail Options Concept Design Report*, which was published in June 2010.

The City of Bellevue and Sound Transit held a joint staff workshop that identified six alternatives comprising elevated, retained-cut, and at-grade options. The City of Bellevue and Sound Transit also agreed on nine evaluation criteria that focused on cost, transportation performance, displacements, noise impacts, parks impacts, and wetlands impacts. The primary concern facing the design effort was the impacts, perceived or actual, to the neighborhoods along 112th Avenue SE. To best integrate the community in the process, efforts were made to offer detailed information to community members to best communicate the alternatives and their impacts as well as avoidance and minimization efforts. The team prepared more than 100 conceptual illustrations that demonstrated how each light rail option might look in various locations along the options studied.

The City of Bellevue and Sound Transit conducted a coordinated public involvement process that included conducting 7 neighborhood briefings and 12 stakeholder interviews, canvassing 419 homes, and conducting 3 community workshops and an open house to share the results of the evaluation. The three workshops built upon one another—first presenting information and gathering community input on the six design options, then presenting the key findings of the *112th Avenue Light Rail Options Concept Design Report* using the criteria Sound Transit and City of Bellevue developed, and at the last workshop, providing an opportunity for the community to compare and analyze key features of the 112th Avenue design options. On July 14, 2010, Sound Transit and the City of Bellevue hosted an open house with 112 attendees to present the results of the 112th Avenue public involvement process, thereby offering another opportunity for the community to provide input on the tradeoffs of each option. The open house also covered the South Bellevue Station and the plans for the Winters House and Bellevue Way.

Comments taken from the community workshops, open house, and community briefings were summarized in the *112th Avenue Outreach Report* (July 2010). This report and its appendices are available to the public on the project website at www.soundtransit.org/eastlink.

The *112th Avenue Light Rail Options Conceptual Design Report* was reviewed by the Sound Transit Board of Directors on June 24, 2010, and by the Bellevue City

Council on July 6, 2010. On July 22, 2010, the Sound Transit Board of Directors directed its staff to study Option 2 (Westside Running to Main Street Tunnel) and Option 6 (Westside Running to At-Grade) in the EIS process.

B.4.5.3 Hospital Station Options

The 2008 Draft EIS included one option in Segment C for locating the Hospital Station within the former BNSF Railway corridor, just north of NE 8th Street. As part of the public involvement process, community comments, value analysis review workshops, and a collaborative evaluation by the Sound Transit and City of Bellevue staffs, three additional locations were identified for evaluation. All four options are located within the former BNSF Railway corridor, which is generally located between NE 8th and NE 12th Streets. The technical analysis considered a variety of factors in evaluating the different options, including cost, station characteristics, walk times, hospital access, environmental impacts, transit-oriented development potential, and construction risk and effects. On July 13, 2010, Sound Transit and the City of Bellevue hosted a public meeting to present the results of the technical evaluation and gather community input on the four design options for the East Link light rail Hospital Station. A total of 32 community members attended.

Based on technical findings and public input, the Sound Transit Board of Directors directed its staff to study Option A (the former BNSF Railway corridor north of NE 8th Street) in the EIS process on July 22, 2010. This is the same Hospital Station location studied in the 2008 Draft EIS, so new analysis of this location was not included in the SDEIS.

B.4.5.4 Issuance of the Supplemental Draft EIS

As with the Draft EIS, the SDEIS included a public hearing in an open house format, where project team members were on hand to answer questions and talk to the public, and court reporters documented the formal hearing. Comments were accepted in writing, transcribed by court reporters, or through email. The public hearing was held on:

Tuesday, November 30, 2010
Bellevue City Hall, 450 110th Avenue NE, Bellevue, Washington

B.4.6 Final EIS

Following a review of public comments on the Draft EIS, the Sound Transit Board identified the preferred alternative for the Final EIS, and it directed that alternatives with other design modifications be considered (May 2009). Following additional work and evaluation of those design modifications, the Sound Transit Board modified the Preferred Alternative in April and July 2010.

Comments on the SDEIS resulted in a number of suggested modifications to existing alternatives in order to avoid impacts to specific properties; in most cases these modifications have not been included in the Final EIS because they generally would result in greater impacts to different properties, including parks, and potentially would increase other impact categories, such as noise, visual, and traffic. The East Link Project Final EIS addresses each suggestion in the response to comments. The Preferred Alternative C9T East Main Station Design Option was added to the Final EIS based on a comment on the SDEIS.

The Preferred Alternative has undergone preliminary engineering (approximately 30 percent design work). This Final EIS analyzes the effects of the Preferred Alternative and all of the other alternatives and responds to comments on the Draft EIS and SDEIS. This Final EIS is issued by FTA, Sound Transit, and WSDOT, and released to the public with a NOA posted in the *Federal Register*, the SEPA register, and local newspapers, and on the Sound Transit website. Additional notification of the availability of this Final EIS is being sent to the project's distribution list of interested parties, agencies, Sound Transit's mailing lists, and addresses within the project vicinity.

Pursuant to FTA guidelines, the Final EIS has been distributed to the Recipient List including federal, state, local, or tribal governmental agencies identified as participating or cooperating agencies and any agency, business, organization, interest group, or member of the public that submitted comments on the Draft EIS and SDEIS. In addition, hard copies of the Final EIS are available for review at local libraries and Sound Transit's office. The documents are also available for viewing on Sound Transit's website. If a build alternative is chosen, then Sound Transit would continue to coordinate throughout final design and construction with affected agencies and local communities.

B.5 Public and Stakeholder Outreach Meetings

While preparing and issuing the Draft, Supplemental, and Final EISs, Sound Transit has hosted and/or participated in several public meetings, workshops, and numerous stakeholder meetings in support of the environmental process. Table B-4 lists the public and stakeholder outreach meetings held to date for the Sound Transit East Link Project.

Appendix C

Environmental Justice

Appendix C

Environmental Justice

C.1 Introduction and Regulatory Framework

This appendix describes the opportunities provided to minority and low-income populations to actively participate in the East Link Project planning process and evaluates whether the project would result in any disproportionately high and adverse effects on individuals in these populations. The analysis was prepared in compliance with Presidential Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations (EO 12898), dated February 11, 1994, and with the U.S. Department of Transportation (USDOT) Order to Address Environmental Justice in Minority Populations and Low-Income Populations (DOT Order).

EO 12898, issued by President William Clinton in 1994, provides that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority and low-income populations." The executive order addresses the importance of public participation in the review process. USDOT issued the DOT Order, which establishes the procedures to use in order to comply with EO 12898 in order to avoid disproportionately high and adverse effects on minority and low-income populations. The DOT Order requires agencies to take two actions:

1. Explicitly consider human health and environmental effects related to transportation projects that may have disproportionately high and adverse effects on minority or low-income populations.
2. Implement procedures to provide "meaningful opportunities for public involvement" by members of minority or low-income populations during project planning and development (DOT Order § 5(b)(1)).

The DOT Order further provides that "In making determinations regarding disproportionately high and adverse effects on minority and low-income populations, mitigation and enhancement measures that will be taken and all offsetting benefits to the affected minority and low-income populations may be taken into account, as well as the design, comparative impacts, and the relevant number of similar existing system elements in non-minority and non-low-income areas" (DOT Order § 8(b)).

The following definitions are from the DOT Order for disproportionately high and adverse effects, minority persons, and low-income persons:

1. Disproportionately high and adverse effect on minority and low-income populations means an adverse effect that: is predominately borne by a minority population and/or a low-income population, or would be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that would be suffered by the non-minority population and/or non-low-income population (DOT Order 5610.2, § Appendix 1(g)).
2. A minority is a person who meets the following criteria:
    - Black (a person having origins in any of the black racial groups of Africa)
    - Hispanic (a person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race)
    - Asian American (a person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands)
    - American Indian or Alaskan Native (a person having origins in any of the original people of North America and who maintains cultural identification through tribal affiliation or community recognition) (DOT Order 5610.2, § Appendix 1(c))
3. A low-income person is identified as a person whose median household income is at or below the Department of Health and Human Services poverty guidelines (DOT Order 5610.2, § Appendix 1(b)).

C.2 Methodology and Approach

The environmental justice analysis for the East Link Project was completed following the guidance documented in Sound Transit's *Environmental Action*

Team Issue Paper No. 36 Implementing Environmental Justice Pursuant to Executive Order 12898 and the Department of Transportation Order to Address Environmental Justice in Minority Populations and Low-Income Populations (Sound Transit, 2001*).* The issue paper was written to provide specific guidance about environmental justice methodology for impact assessment and public outreach. The issue paper describes the three processes to be used when implementing an environmental justice analysis: public involvement processes, analyzing potential disproportionate high and adverse effects, and documentation.

The environmental justice analysis describes the demographics of the East Link Project study area using the most recent U.S. census data available at the time the analysis was initiated (2000); provides information on the efforts that Sound Transit has made to involve minority and low-income populations in the East Link Project; and assesses whether the East Link Project would result in disproportionately high and adverse effects on minority and low-income populations, taking into consideration mitigation and enhancement measures and project benefits, as appropriate. The analysis of potentially disproportionate high and adverse effects is based upon the information developed in this Final EIS and the accompanying technical appendices in Appendix F and the technical reports in Appendix H.

C.3 Study Area Demographics

The study area that was used for the environmental justice analysis is a 0.5-mile radius around the East Link Project alternatives. This radius was identified as the area most likely to receive the greatest impact, both positive and negative, as a result of the project. Sound Transit reviewed 2000 Census data to determine the demographic composition of minority and low-income populations located within the study area, then developed geographic information system (GIS) maps to illustrate the minority and income characteristics of the population in the study area. The study area includes census blocks or census block groups that are either located entirely or partially within the 0.5-mile radius. Minority populations were analyzed at the census block level, while income information was reviewed at the census block group level because income information is not available at the census block level. Exhibits C-1 and C-2 show minority percentages in the study area, and Exhibits C-3 and C-4 show percentages of the population below the poverty line.

As shown in Exhibits C-1 and C-2, most of the census block groups and blocks in the study area have minority population concentrations in the 0 percent to 25 percent and 25 percent to 50 percent ranges. The higher concentrations of minority populations are located within Segment A in the City of Seattle, specifically in neighborhoods in the Chinatown/International District, Central Area, and North Rainier Valley. As shown in Exhibits C-3 and C-4, most of the low-income population concentrations within the Census Block Groups are in the 0 percent to 25 percent range. A higher concentration of low-income population is also located in the Chinatown/International District, Central Area, and North Rainier Valley neighborhoods of Seattle in Segment A, although these are largely in the 25 percent to 50 percent range. Additional information on the benefits of the project to these groups is discussed in Section C.6.

What are Census Tracts, Block Groups, and Blocks?

A census tract is a small subdivision of an urban area used by the U.S. Census Bureau to identify population and housing statistics. Census blocks are subdivisions of census tracts and are the smallest unit of census geography for which the Census Bureau collects data. The boundaries of census blocks are generally streets or other notable physical features and often correspond to a city block. A census block group is a combination of census blocks, typically encompassing two to four city blocks. The census collects some information at the block level, some at the block group level, and some at the tract level.

The 2000 Census data may no longer reflect current conditions in some areas within 0.5 mile of the East Link Project alternatives. For example, redevelopment within census block groups and census blocks in Downtown Bellevue and east of Downtown Redmond (Segments C and E) has resulted in areas where populations have been relocated and no residential populations exist. To supplement the Census data, Sound Transit collected and reviewed data for public elementary schools within attendance boundaries that cross the study area because such data are more current that Census data.

The analysis used elementary schools because their attendance boundaries tend to be more representative of the study area and are smaller than middle and high school boundaries. However, the attendance boundaries for these elementary schools do include areas that fall outside of the study area.

Exhibit C-4 **Low Income Population Within Census Block Group Segments B,C,D, and E**
East Link Project

Consequently, the minority and low-income population data in Table C-1 are representative of children who may live anywhere within the attendance boundaries and not necessarily within the study area. Although the school data do not provide for a direct comparison with the Census data, they are useful in giving a more recent general demographic characterization of the population of the study area because the U.S. Census data are more than 10 years old and despite the mismatch of the boundaries. In addition, student data for the Seattle Public Schools represents those students who attend the school and may not reside in the surrounding area due to the ability of parents to select which Seattle public school their children can attend. Data were collected from the U.S. Department of Education Common Core of Data for Seattle Public Schools, Mercer Island School District, Bellevue School District, and the Lake Washington School District and are based on the 2008-2009 school year. School data enrollment is characterized by race/ethnicity and as a result there may be differences in the demographic information as it relates to Census data, which includes separate tables for race and ethnicity. The low-income information collected is based on students who participate in a free-lunch program.

When the minority populations of the 2008-2009 school year data are compared to the 2000 Census data, most of the areas in the study area appear similar and there are no major differences except in the Seattle area. In the Seattle area, the school data for the four elementary schools in the study area (Beacon Hill, Leschi, Thurgood Marshall, and Gatzert) indicate that approximately 91 percent of the elementary students are considered minority, which may indicate the overall population would be similar, whereas the Census data indicate the minority population to be approximately 51 percent, a potential 40-percent increase since the 2000 Census. The low-income data are similar for all areas. Because the elementary school information is based only on the portion of the general population that attends public schools, the data may not truly reflect the actual population that resides in the East Link Project study area. Therefore, as stated earlier, the school data and the Census data do not allow for direct comparisons, only for potential indicators in changing demographics.

The Census data may not reflect the current conditions for the areas where the project would result in the relocation of residents. If the analysis of project effects, mitigation measures, and project benefits had indicated potential disproportionately high and adverse effects, additional demographic analysis in the areas discussed above would have been performed to determine with greater specificity the populations that would be affected. However, as described in Section C.5, no potential disproportionately high and adverse effects were identified

C.4 Outreach to Minority and Low-Income Populations

As part of East Link Project public outreach, Sound Transit has made it a priority to engage diverse minority and low-income populations early in the planning and development process by providing materials and making them available in multiple formats. Public participation is a key component of EO 12898 and the DOT Order. Sound Transit has developed numerous events and tools to successfully engage and communicate with the public, including scoping meetings, workshops, fact sheets/handouts, posters, display advertisements, stakeholder briefings, project information provided at community events and festivals, and a project website that is regularly updated throughout the project. General public involvement in the project is described in Appendix B, Public and Agency Involvement.

Before scoping, Sound Transit reviewed the minority and income characteristics of the population in the East Link Project vicinity to identify minority and low-income populations. Based on this information, public involvement has included, and will continue to include, outreach at key milestones specific to those groups using the public involvement tools developed by Sound Transit. Initially, based on 2000 Census data, Sound Transit literature included a language block (i.e., text box on the literature) translated into Russian, Chinese, Spanish, and Tagalog regarding contacting and speaking with Sound Transit staff in those languages about the East Link Project. Based on community input, in 2008 Vietnamese and Farsi were included in the language blocks, and in 2010 Tagalog and Farsi were removed and Korean, Hindi, and Japanese were included in the language blocks. Sound Transit has identified organizations that serve minority, non-English speaking, or low-income populations within the East Link Project vicinity and these organizations have been entered into the project mailing list.

Source: National Center for Education Statistics, 2010

These organizations were sent postcards associated with scoping, Draft EIS, and Supplemental Draft EIS (SDEIS) public meetings and hearings. Follow-up phone calls were made to find out whether the organizations needed any additional information about the East Link Project, and they were reminded how they could submit public comments. Organizations were also asked if they would like project staff to meet with members of their organization to review the scoping information. Staff have met with and briefed the management team of Hopelink, which serves the greater Eastside community.

Public involvement and outreach actions targeted at minority and low-income populations, as defined under the DOT Order, include the following efforts:

- Perform continued consultation with key community organizations for assistance in outreach to minority and low-income individuals.
- Provide agency and project-specific information to key community organizations that serve the minority and/or low-income populations prevalent in the areas to be served by or in the vicinity of the East Link Project.
- Present project information at meetings held at community venues in locations with minority and/or low-income populations likely to be served by the East Link Project and/or directly affected by construction activities.
- Provide publication-specific translated language blocks, in Russian, Chinese Mandarin, Spanish, Vietnamese, Korean, Hindi, and Japanese on outreach materials produced for the East Link Project.
- Offer interpretation services for all public meetings for deaf and non-English speaking community members.
- If Sound Transit is contacted by anyone who has limited use of English, Sound Transit staff can access an immediate over-the-phone interpretation service provided by Telelanguage, a full-service language interpretation and translation company that provides interpretation in 150 languages, 24 hours a day and 7 days a week

Additional project specific processes related to outreach are discussed as follows.

C.4.1 Scoping Meetings

Sound Transit began the Draft EIS process for East Link in 2006 with four public scoping meetings that were held at locations throughout the East Link Project vicinity, providing a variety of locations and dates to maximize opportunity for attendance. The scoping meetings were advertised by sending postcards to over 150,000 residents and businesses in the project vicinity, including the list of organizations that served minority and low-income households. In addition, display advertisements with the scoping meeting details were placed in local publications. Sound Transit received approximately 300 written and oral comments, which included expressions regarding preferences for a particular alternative or addressing a specific segment or some larger concern for the East Link Project as a whole.

In addition to the public scoping meetings, Sound Transit held an agency scoping meeting and invited tribes with interests in the East Link Project vicinity. Sound Transit identified the Muckleshoot Tribe, Snoqualmie Tribe, Suquamish Tribe, Tulalip Tribe, Yakama Tribe, and Duwamish Tribe as those tribes with interests in the project vicinity. The project vicinity does not include any tribal lands, but the tribes are expected to have interests regarding natural and cultural resources. Communications and coordination with the tribes regarding cultural resources are documented in the Historic and Archaeological Resources Technical Report (Appendix H4).

C.4.1.1 Targeted Outreach January 2007 through September 2008

In early 2007, Sound Transit held a series of five East Link Project route and station workshops at locations throughout the project vicinity in order to educate workshop participants about the project. The workshops also were intended to obtain design feedback and community knowledge to assist in the development of station concepts, right-of-way requirements, and routes, and to identify any neighborhood-specific issues. Sound Transit mailed workshop notification flyers to over 85,000 residential and business addresses that were within 0.5 mile of all alternatives based on postal carrier routes, as well as all of Mercer Island. These carrier routes include minority and low-income residents. Common themes at these workshops included preserving key community and environmental resources, minimizing changes in the character of neighborhoods, providing direct access to stations, and preventing noise and visual impacts of an elevated guideway.

Advertisements for the scoping meetings and workshops included postings in a number of ethnic publications, such as *Chinese Post*, *El Mundo*, *Russian World*, and *The Skanner*. Notice of the meetings was also posted at community centers, public libraries, and post offices in Seattle, Mercer Island, Bellevue, and Redmond.

In mid-2007, Sound Transit expanded the list of organizations that serve minority, non-English speaking, low-income, and senior populations in East King County and mailed each (approximately 50 organizations) an outreach letter and a packet of East Link Project information. These organizations included service organizations (i.e., Bellevue Family YMCA, Department of Social and Health Services [DSHS] King Eastside Community Services Office, Eastside Refugee and Immigrant Coalition [ERIC], Hopelink, and Senior Services), ethnic churches (i.e., Holy Cross Chinese Lutheran Church, Bellevue First Romanian, and Highland Covenant Church), and foreign language schools (i.e., Northwest Chinese School and Bel-Red Bilingual Academy). The information was sent to inform these organizations about the project as well as to learn about the populations they serve and obtain contact information of individuals who would like to be kept informed on the East Link Project. Offers were made in the letter to translate any of the project-related information into a different language to facilitate populations learning about the project. Sound Transit made follow-up telephone calls to each organization and asked if there were any questions or to inquire about meeting with the organization. Sound Transit conducted additional follow-up with these organizations, and additional meetings were held as the project continued. On September 7, 2007, Sound Transit staff met with Barb Tuininga, the coordinator the City of Bellevue Mini City Hall located in Crossroad Mall in northeast Bellevue to discuss Sound Transit's outreach to minority or low-income populations in east King County and to find out more information about the minority and low-income populations that use the Mini City Hall services.

In March 2008, a project update was mailed to over 85,000 businesses and residences located within 0.5 mile of the alternatives, including all of Mercer Island, and anyone who requested to be on the East Link mailing list. In addition, Sound Transit mailed the project update to the 50 community organizations previously identified. The project update provides information on the project status and next steps, as well as reminding the public that Sound Transit staff is available to meet with them to answer any questions they might have about the project. Throughout this period, Sound Transit has maintained an up-to-date East Link Project webpage with project-related information, frequently asked questions (FAQs), a document library, and staff contact information.

C.4.1.2 Targeted Outreach for the Draft EIS Release

The release of the Draft EIS included a public notice, request for comments, and public hearings and opportunities for comment. Additional targeted outreach to the 50 community groups and organizations serving low-income, minority, and senior populations in the project vicinity was also conducted around the release of the Draft EIS and the subsequent comment period. Sound Transit prepared a Draft EIS fact sheet and translated the Draft EIS fact sheet into Russian, Chinese, Spanish, Tagalog, Vietnamese, and Farsi, then distributed these to the community groups and made them available on the project website and at the public hearings. The fact sheet and translations were also distributed at public places such as Bellevue's Mini City Hall, community centers, and public libraries. Staff also translated the fact sheet into additional languages upon request. Each community group was sent a letter with a packet of information to accomplish the following:

- Notify them that the Draft EIS is available
- Tell them where to find the Draft EIS online or how to request a hard copy
- Define what the comment period is
- Explain how to comment on the Draft EIS
- Provide details on the public hearings

Staff followed up with a phone call to each group to answer questions, explain the comment period process, explain how they can provide comments, offer to provide a briefing to staff or clients, and ask whether they would like additional copies of the Draft EIS fact sheet or other materials in English or translated into the language they identify.

Sound Transit translated display advertisements announcing the release of the Draft EIS and comment period for publication in minority newspapers that serve the Eastside. The East Link Project website was also updated during this time with information on the Draft EIS process; a link to the electronic version of the Draft EIS document; the comment period, time, and location of public hearings; how to request an interpreter at the meeting; and how to submit a comment.

C.4.1.3 Targeted Outreach for the Supplemental Draft EIS Release

The release of the SDEIS in November 2010 included the following forms of outreach:

- Public notice in local newspapers and online publications

- Announcement of the public hearing and project update sent to the addresses or post office boxes of those who live within 0.5 mile of the proposed alternatives
- Email notice to those in the project database and project listserv
- Notice on the Sound Transit website and East Link Project website
- Public hearing

Before the SDEIS was published, Sound Transit reviewed and updated its list of community groups and organizations. The agency then conducted additional targeted outreach to 85 community groups and organizations serving low-income, minority, and senior populations in the project vicinity around the release of the SDEIS and the subsequent comment period. Sound Transit prepared a SDEIS fact sheet and translated it into Russian, Chinese Mandarin, Spanish, Vietnamese, Korean, Hindi, Japanese, and Braille and made it available to community groups and individuals. Sound Transit conducted similar activities as during the distribution of the 2008 Draft EIS, which included distributing the fact sheets, providing translations at public places, and distributing a letter and making telephone calls to each community group and organization offering a separate briefing and opportunities to speak directly to staff.

Sound Transit translated display advertisements announcing the release of the SDEIS and comment period for publication in minority newspapers that serve the Eastside. The East Link Project website was updated with information on the SDEIS process; a link to the electronic version of the SDEIS document; the comment period, time, and location of the public hearing; how to request an interpreter at the meeting; and how to submit a comment.

C.4.1.4 Targeted Outreach for the Final EIS Release

The release of the Final EIS included the following forms of outreach:

- Public notice in local and online newspapers
- Email notification to the project listserv
- Postcard to those in the project database
- Notice on the Sound Transit website and East Link Project website
- Announcement sent to addresses or post office boxes of those who live within 0.5 mile of the proposed alternatives, including community groups and organizations who serve them

The above outreach was carried out in an effort to ensure notification of the Final EIS and provide opportunities for community members and organizations to discuss the Final EIS with project staff. The Final EIS was circulated as required under the National Environmental Policy Act (NEPA) and the State Environmental Policy Act (SEPA) and includes the responses to comments made on the Draft EIS and the SDEIS.

Similar to outreach activities for the 2008 Draft EIS and the 2010 SDEIS, Sound Transit sent each identified community group and organization a letter and fact sheet on the Final EIS with information regarding its publication. Fact sheets were translated it into Russian, Chinese Mandarin, Spanish, Vietnamese, Korean, Hindi, Japanese, and Braille and were made available to community groups and individuals. Staff followed up with telephone calls to each group to answer questions, offer to provide a briefing to staff or clients, and ask whether they would like material translated into the language they identify. In addition to placing display advertisements in local newspapers and online publications, Sound Transit translated display advertisements announcing the release of the Final EIS in minority newspapers that serve the Eastside. The East Link Project website was updated with a link to the electronic version of the Final EIS document, how to contact staff for questions or request an interpreter, and next steps of the project.

C.5 Project Impacts and Mitigation

The DOT Order requires agencies to explicitly consider human health and environmental effects related to transportation projects that may have a disproportionately high and adverse effect on minority or low-income populations. Section 8.b of the DOT Order allows for mitigation and enhancement measures to be taken into consideration when determining project impacts. Table C-2 summarizes the impacts identified in the elements that have been analyzed for the EIS and that can be differentially distributed, as well as any mitigation that would reduce or eliminate the impacts. Overall, the East Link Project would result in impacts that would affect all populations to the same degree. Table C-2 also provides information for those elements where the project would result in beneficial impacts or the impacts would accrue to a different degree to minority and low-income populations. Most impacts associated with the East Link Project would be effectively mitigated, and the remaining impacts would be limited in scope and/or duration. Therefore, the East

Link Project would not result in any impacts that would be considered disproportionately high and adverse under EO 12898 and the DOT Order. Complete information on the project impacts is provided in Chapters 3 and 4 of this Final EIS. Mitigation measures are provided in Appendix I.

In addition, as described in Section C.6, the East Link Project would have several beneficial effects, particularly for minority and low-income populations. These benefits further support the conclusion that no disproportionately high and adverse effects would result.

C.6 Project Benefits

Under the DOT Order, the benefits of a proposed transportation project may be taken into account when determining whether any disproportionately high and adverse effects on minority and low-income populations would occur. Operating the East Link Project would provide a number of benefits, including improved access to transit; a safer, more reliable, and more efficient transportation system; improved mobility through the project vicinity; transit travel time savings; improved accessibility to employment; and extended transit service hours.

While all populations within the project's service area would realize these benefits to the same extent, they would accrue to a higher degree to minority and low-income populations as described in the following subsections. These transit benefits further support the conclusion that the East Link Project would not result in disproportionately high and adverse effects on minority and/or low-income populations.

TABLE C-2
Summary of Potential Impacts and Mitigation

Element of the Environment	Impact Summary for Build Alternatives	Mitigation Summary
Transportation	• Improved transit travel times, reliability, and convenience. • Approximately a 0.2 percent reduction in both vehicle miles traveled and vehicle hours traveled. • Impacts related to the loss of parking spaces and impacts on property access and circulation related to the loss of left-hand turn movements and turning restrictions of right in and right out. • Beneficial for all populations who use transit, including minority and low-income populations.	• Turn pockets would be provided to increase capacity and improve intersection level of service. • Sound Transit would work with business districts to develop impact minimization efforts during construction. • U-turn movements would be provided at intersections, where movement is allowed. • Sound Transit would work with the local agencies regarding stations that are located within the median of roadways to ensure that appropriate treatments are provided for safe and effective pedestrian access.
Acquisitions, Displacements, and Relocations	• Segment A would have no impacts, but the other segments would require full property acquisitions and displacement of existing uses. Depending on the alternative and/or design option selected, full acquisitions range from 1 to 20 in Segment B, 4 to 36 in Segment C, 2 to 18 in Segment D, 6 to 16 in Segment E, and 3 to 18 for the Maintenance Facility. • Residential relocations would occur within Segments B, C, and E, where the minority and low-income population concentrations are low.	• Residents and businesses displaced by the East Link Project would receive compensation and relocation assistance in accordance with the provisions of Sound Transit's adopted Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines. • Residents and businesses would be compensated for portions of property required for project – temporary or permanent use.
Land Use	• Acquisitions in all the segments represent only a small portion of the land available in the study area, and some property acquired could be sold and redeveloped after construction. Land acquired would convert from existing use to a transportation-related use. • All alternatives would be consistent with regional and local plans and polices.	• No mitigation is required or proposed.

TABLE C-2 CONTINUED
Summary of Potential Impacts and Mitigation

Element of the Environment	Impact Summary for Build Alternatives	Mitigation Summary
Economics	• Aside from Segment A, all segments would result in business and employee displacements; however it is expected that business displacements would be relocated, and, therefore, no long-term impacts on employees are anticipated. • Aside from Segment A, there would be temporary reduction in tax revenues due to property acquisitions and conversions of land; however, redevelopment is expected to offset the initial loss and the economic benefits from transit-oriented development could result in additional tax revenues and business and employment growth • Build alternatives could result in changes in access, circulation, and the loss of parking, which could result in economic impacts for some of the businesses in the project vicinity. • Based upon a review of the businesses that could be displaced, none were identified that provide any services that would be considered uniquely important to minority and/or low-income populations (e.g., ethnic grocery store or food bank). Businesses could be owned by minorities or employ minorities and/or low-income populations; however, it is expected that the businesses would be relocated and no jobs would be lost. Impacts would not accrue to a greater degree to minority or low-income populations.	• Businesses displaced by the East Link Project would receive compensation and relocation assistance in accordance with the provisions of Sound Transit's adopted Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines.
Social, Neighborhoods, Community	• East Link would provide a reliable mode of transportation and improved transit accessibility. • East Link would not result in adverse effects on any of the identified neighborhoods in the project vicinity. • Project would not create any barriers to interaction and could enhance cohesion as new meeting points for adjoining neighborhoods. Increased transit access and transit-oriented development could also improve cohesion. • The East Link Project would result in beneficial impacts for all populations.	• No mitigation is required or proposed.
Visual and Aesthetic Resources	• Segments A and D would have no impacts, and Segments B, C, and E would experience impacts on the existing visual quality for most of the alternatives. In general, these impacts would be the result of vegetation removal, construction of retaining walls, and the introduction of an elevated structure depending on the alternative. In Segment C, the portions of the tunnel alternatives underground would not change any visual quality categories and the elevated alternatives would block views. • There would be no differences in impacts on all populations.	• Where applicable, Sound Transit would provide replacement landscaping and consult with affected jurisdictions. • Where possible, Sound Transit would preserve existing vegetation.
Air Quality	• No new violations of federal air quality standards would occur, and a slight decrease in regional air emissions is anticipated. • The East Link Project would result in beneficial effects for all populations.	• No mitigation is required or proposed.
Noise and Vibration	• Noise impacts on living and sleeping quarters would be mitigated. • Most of the vibration impacts would be mitigated. Areas where vibration impacts could not be mitigated include a commercial location and up to two multifamily residences in Segment C (depending on the connection with Segment B) and a single-family residence in Segment E. None of these locations contain minority or low-income population where the impacts would accrue to a different degree. • There would be no differences in the noise and vibration impacts on all populations.	• Noise and vibration impacts would be mitigated by installing residential sound insulation, sound walls, special trackwork, or other measures.

TABLE C-2 CONTINUED
Summary of Potential Impacts and Mitigation

Element of the Environment	Impact Summary for Build Alternatives	Mitigation Summary
Ecosystems	• None of the alternatives in any of the project segments would result in any adverse effect on threatened or endangered species. • Segment A would not have any impacts. Segments B, C, D, and E would all have wetland impacts and/or the loss of high-value habitat. • There would be no negative impacts on fish passages or fish habitat after mitigation.	• Compensatory mitigation-to-impact ratios would be used for replacement of wetlands. • Improved habitat features would be provided to improve salmonid spawning and rearing functions.
Water Resources	• Overall, the East Link Project would increase the amount of existing impervious surface area by approximately 16 to 35 acres (including a maintenance facility), depending on the alternatives selected. • Alternatives would result in a reduction in groundwater recharge; however, because the project is linear, it is not expected to result in a substantial decline in groundwater level or other serious groundwater impacts.	• Stormwater would be managed according to applicable regulatory requirements. • No additional mitigation would be required or proposed.
Hazardous Materials	• Use of and generation of hazardous materials would occur at the maintenance facility. • No known potential hazardous material sites would be impacted by Segment A or the Maintenance Facility sites. • All Segment B, C, D, and E alternatives have the potential to encounter high-risk sites.	• Hazardous waste would be managed and contaminated sites cleaned up according to applicable regulatory requirements. • Engineering controls would be constructed to minimize and contain releases and spills.
Electromagnetic Fields	• Anticipated electromagnetic field intensities would not result in impacts that would negatively affect human health. Locations of human exposure within and adjacent to the light rail line are considerably below established exposure guidelines.	• No mitigation is required or proposed.
Public Services	• The alternatives are not expected to result in any negative impacts on overall crime rates in the surrounding neighborhoods. • There is the potential for minor increases in response times due to loss of some left-hand turns, and access for fire and emergency medical services at elevated sections of the track and stations would be more difficult than on the at-grade sections. These situations would not result in any adverse impacts on public services since these situations are few and infrequent.	• Sound Transit would implement a Security and Safety Management Plan and a Fire and Life Safety Committee to address safety and security issues throughout design, construction, and operation. • Measures to minimize crime would include the use of equipment (e.g., closed-circuit television, sealed fareboxes, and automatically sealed exits), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel.
Utilities	• No long-term impacts on natural gas, electricity, telephone, telecommunications, water, or wastewater are expected with any of the alternatives in any of the segments.	• No mitigation is required or proposed.
Historic and Archaeological	• The project would be located in proximity to historic properties in Segments A, B, C, D, and E. Potential impacts could occur at three historic resources depending on the alternatives selected: the Justice White House with Alternative E4; the potential Surrey Downs Historic District during construction of *Preferred Alternative C11A* or Alternatives C2T, C3T, or C4A; and the Winters House during the construction of *Preferred Alternative B2M*. • No archaeological sites were encountered during investigations.	• A draft Memorandum of Agreement to refine the mitigation measures for the Winters House, potential Surrey Downs Historic District, and Archaeological resources is included in Appendix I.
Parkland and Open Space	• Aside from Segment D, all segments would acquire parkland and open space. Segment A would require 0.4 to 0.6 acre from three parks, depending on whether the pedestrian bridge is selected. Segment B would require between 0.7 and 3.0 acres, depending on the alternative, on up to two parks, including the complete acquisition of the Bellevue Way greenbelt (deemed an insignificant park resource by City of Bellevue) under Alternative B1. Within Segment C, affected parkland would be between 0 and 1.4 acres, depending on the alternative, on up to three parks.	• Where necessary, Sound Transit would acquire replacement land pursuant to Washington State Recreation and Conservation Office and Section 6(f) requirements or provide financial compensation as agreed with the affected jurisdiction. • Other measures would include maintaining access where feasible.

TABLE C-2 CONTINUED
Summary of Potential Impacts and Mitigation

Element of the Environment	Impact Summary for Build Alternatives	Mitigation Summary
	With the Segment C alternatives that would affect McCormick Park during construction, there is the potential for a net gain of up to 1.6 acres of parkland after construction. Segment E would require between 0.2 and 2.0 acres of parklands from up to seven parks and trails, depending on the alternative.	
Construction (construction-related impacts are temporary and limited in duration)	• Aside from Segment A, there would be temporary lane closures, traffic detours, loss of parking, and increased truck traffic for all alternatives, which could negatively affect residents, businesses, and public service providers. • Temporary impacts on the quality of existing land uses due to construction-related activities, including increases in noise levels, dust, traffic congestion, and increased access difficulty. • Adverse impacts on businesses due to lack of access, circulation, and parking. • Increased access and response times for public service providers (fire and emergency medical, police, school buses including King County Metro buses, and solid waste and recycling vehicles). • Temporary visual quality impacts due to the removal of vegetation and demolition of structures. • Potential release of hazardous materials during demolition of buildings. • Relocation of utilities in during construction in Segments B through E. • Construction impacts on historic buildings, including include the temporary loss of access along with visual impacts, noise, vibration, and the dust and debris from construction activities. • For park users, increased noise, dust, and temporary access restrictions where alternatives are located adjacent to or on park property. • Construction easements and staging areas resulting in temporary impacts on parks within Segment B, C, and E, including the Mercer Slough Nature Park, Surrey Downs Park, McCormick Park, and Marymoor Park.	• Haul routes would be developed as approved by local jurisdictions to avoid residential neighborhoods to the extent possible. • Property access would be maintained as much as possible. • Detour signage would be provided where needed. • Sound Transit would work with business districts to develop impact minimization efforts during construction. • Sound Transit would coordinate and work with public service providers on developing any required detour routes and lane closures to minimize increases in travel and response times or interference with collecting solid waste and recyclables or transporting students. • Access and egress for fire and emergency medical would be maintained at all times, which would minimize impacts on response and travel times within all project segments. • Disturbed parks would be restored after construction. Other construction period mitigation measures would include maintaining access during construction and providing financial compensation for temporarily using land outside the light rail right-of-way for construction. • Noise and visual screening would be provided from adjacent land uses where appropriate. • Any temporary property use during construction would be compensated according to the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Code of Federal Regulations Title 49, Part 24), and the State of Washington's relocation and property acquisition regulations (Revised Code of Washington 8.26). • Precautions would be taken that historic properties are protected from vibrations, excavations, dirt, dust, and damage from heavy equipment. • Best management practices would be implemented to control dust and stormwater runoff. • Sites where contamination might be present will be assessed, including surveying structures to determine whether they contain hazardous building materials. • A spill pollution control and countermeasure plan and a stormwater pollution prevention plan would be prepared to manage and prevent the release of pollution and hazardous substances to the environment.

FTA	Federal Transit Administration
SHPO	Washington State Historic Preservation Office

C.6.1 Improved Access to Transit

Improved access to transit would result for all those populations within the service area and in particular for those populations residing within 0.5 mile of the stations because of the proximity to the stations. In addition, the extended transit service hours (20 hours per day, Monday through Friday) would also improve access to transit for all populations within the service area due to the longer service period. The demographic makeup of potential ridership was estimated using the demographics of the areas within 0.5 mile of the stations for each of the project alternatives. One-half mile was used because studies have shown residents would walk this distance to access transit. These estimates are based on a GIS extraction of 2000 Census data for the census blocks and census block groups within each station area, and the population data for residents living within the station areas were then aggregated to create a demographic profile of the total population that would have improved access to transit benefit. Table C-3 lists the populations that would have improved access to transit within 0.5 mile of stations for each alternative within each segment.

Based on the information in Table C-3, the minority population concentration ranges from 14.4 to 50.7 percent and low-income population ranges from 4.7 to 13.7 percent for those populations that are within 0.5 mile of the stations within each segment. Segment A has the highest concentrations of minority and low-income populations that would be provided access, which is primarily around the Rainer Station. The Rainier Station, bus routes serving this station, and the East Link connection to the Central Link system would provide greater access for residents of the Rainier Valley and Central District.

TABLE C-3
Access to Light Rail Stations for Minority and Low-Income Populations

Project Alternative and Connection		**No. of Stations**	**2000 Census Block Population with Access**	**Minority Population with Access**	**2000 Census Block Group Population**	**2000 Low-Income Population with Access**
Segment A, Interstate 90						
Preferred Interstate 90 Alternative (A1)	-	2	12,114	6,145 (50.7%)	19,977	2,742 (13.7%)
Segment B, South Bellevue						
Preferred 112th SE Modified Alternative (B2M)	To *Preferred Alternative C11A*	1	2,747	406 (14.4%)	4,912	229 (4.7%)
	To *Preferred Alternative C9T*[b]	2	5,664	1,059 (18.7%)	12,070	661 (5.5%)
Bellevue Way Alternative (B1)	-	1	2,810	406 (14.4%)	4,912	229(4.7%)
112th SE At-Grade Alternative (B2A)[a]	-	2	5,417	1,020 (18.8%)	11,045	614 (5.6%)
112th SE Elevated Alternative (B2E)[a]	-	2	5,589	1,037 (18.6%)	10,963	541(4.9%)
112th SE Bypass Alternative (B3)	-	1	2,747	406 (14.8%)	4,912	229 (4.7%)
B3 - 114th Extension Design Option	-	1	2,747	406 (14.8%)	4,912	229 (4.7%)
BNSF Alternative (B7)	-	1	3,024	590 (19.5%)	5,422	243 (4.5%)
Segment C, Downtown Bellevue						
Preferred 108th NE At-Grade Alternative (C11A)	-	3	9,264	2,234 (24.1%)	15,218	1,184 (7.8%)
Preferred 110th NE Tunnel Alternative (C9T)	From Alternative B2A and B2E[a]	2	5,393	1,284 (23.8%)	11,794	855 (7.2%)
	From Alternative B3 and B7[a]	3	7,027	1,686 (24.0%)	14,412	963 (6.7%)
C9T - East Main Station Design Option [b]	From *Preferred Alternative B2M*	3	7,371	1,874 (25.4%)	16,353	1,211 (7.4%)
Bellevue Way Tunnel Alternative (C1T)	-	3	10,289	2,338 (22.7%)	16,890	1,188 (7.0%)

TABLE C-3 CONTINUED
Access to Light Rail Stations for Minority and Low-Income Populations

Project Alternative and Connection		No. of Stations	2000 Census Block Population with Access	Minority Population with Access	2000 Census Block Group Population	2000 Low-Income Population with Access
106th NE Tunnel Alternative (C2T)	From Alternative B2A and B2E[a]	2	7,095	1,686 (23.8%)	13,182	891 (6.8%)
	From Alternative B3 and B7[a]	3	9,003	2,122 (23.6%)	15,800	999 (6.3%)
108th NE Tunnel Alternative (C3T)	From Alternative B2A and B2E[a]	2	6,557	1,410 (21.5%)	12,025	781 (6.5%)
	From Alternative B3 and B7[a]	3	8,523	1,910 (22.4%)	14,643	889 (6.1%)
At-Grade Couplet Alternative (C4A)	From Alternative B2A and B2E[a]	3	6,755	1,446 (21.4%)	12,025	781 (6.5%)
	From Alternative B3 and B7[a]	3	8,721	1,946 (22.3%)	14,643	889 (6.1%)
112th NE Elevated Alternative (C7E)	From Alternative B2A and B2E[a]	2	5,242	1,222 (23.3%)	10,637	745 (7.0%)
	From Alternative B3 and B7[a]	3	6,352	1,463 (23.0%)	13,255	853 (6.4%)
110th NE Elevated Alternative (C8E)	From Alternative B2A and B2E[a]	2	4,526	942 (20.8%)	10,637	745 (7.0%)
	From Alternative B3 and B7[a]	3	6,492	1,442 (22.2%)	13,255	853 (6.4%)
110th NE At-Grade Alternative (C9A)	From Alternative B2A	2	5,024	1,256 (25.0%)	11,794	855 (7.2%)
	From Alternative B3 and B7[a]	3	6,900	1,683 (24.4%)	14,412	963 (6.7%)
114th NE Elevated Alternative (C14E)	-	2	5,659	1,415 (25.0%)	10,270	795 (7.7%)
Segment D, Bel-Red/Overlake						
Preferred NE 16th At-Grade Alternative (D2A) [c]	-	4	14,352	5,745 (40.0%)	25,011	1,902 (7.6%)
D2A - NE 24th Design Option	-	4	17,652	7,195 (40.8%)	32,553	2,606 (8.0%)
NE 16th Elevated Alternative (D2E)	-	3	12,158	5,131 (42.2%)	26,030	2,290 (8.8%)
SR 520 Alternative (D5)	-	1	8,243	3,522 (42.7%)	13,987	1,238 (8.9%)
Segment E, Downtown Redmond						
Preferred Marymoor Alternative (E2)	-	2	8,692	2,389 (27.5%)	19,352	1,592 (8.2%)
E2 - Redmond Transit Center Design Option	-	3	9,824	2,602 (26.5%)	20,344	1,670 (8.2%)
Redmond Way Alternative (E1)	-	2	8,637	2,421 (28.0%)	14,642	1,361 (9.3%)
Leary Way Alternative (E4)	-	2	8,647	2,430 (28.1%)	14,642	1,361 (9.3%)

[a] These alternatives contain the same population numbers and, therefore, were combined.

[b] An C9T - East Main Station Design Option has no SE 8th Station in Segment B with *Preferred Alternative C9T* connectors; therefore, the demographics are the same as *Preferred Alternative B2M* connecting to *Preferred Alternative C11A*.

[c] D2A - 120th Station Design Option would have the same impacts as those for *Preferred Alternative D2A*.

Source: U.S. Census, 2000.

In the other segments, the minority and low-income percentages of the population that would receive the benefit are similar; however, there are project alternatives that include a larger number of stations than other alternatives within a particular segment and, therefore, would have a larger population receiving the benefit of improved transit access. This is not well reflected among the Segment D alternatives, where the SR 520 Alternative (D5) has two fewer stations than the others, but the ridership is similar. The Bel-Red and Overlake area in Segment D is planned for high-density employment, and, therefore, access to job opportunities may not be as great with D5 for transit riders because of fewer stations.

It has been documented in a number of studies that minority and low-income populations tend to make greater use of transit service than other groups, indicating that the transit service improvements are generally more important to these populations than to other members of the population. Data from the American Public Transportation Association (APTA, 2008) indicates that in 2007 approximately 60 percent of all transit passengers were minority. In addition, data from the 2000 U.S. Census for King County (USDOT, 2004) indicate that 23 percent of all workers who take public transit to get to and from work are from households earning less than $30,000 per year. These same individuals comprise only about 12 percent of all workers in the county. In other words, the rate at which these individuals take public transit is almost twice their rate of occurrence in the county worker pool. With low-income populations taking public transit at a higher rate than their higher income counterparts, the transit operations benefits provided by the project would be key benefits to low-income populations.

C.6.2 Transit Travel Time Savings

Another benefit of the East Link Project would be a reduction in average transit travel times for East Link users. Average transit travel time is the time that it takes someone to travel from door to door (i.e., from the front door of their home to the front door of their work) by a composite of modes (i.e., auto, bus, bicycle, pedestrian, and light rail). The Sound Transit Ridership Model was used to calculate the travel time savings with transit trips in the afternoon (PM) travel period. Trips originate from throughout the region and are destined for each station cluster in the PM peak period. Because most trips in the PM peak period are made by individuals from the workplace to home, the outcome largely describes morning (AM) transit travel time savings also (only in the opposite direction) by those who reside in the station clusters. The results of the transit travel time savings analysis for those who reside in the East Link Project study area are summarized in Table C-4. As shown in Table C-4, the East Link Project would improve the average transit travel time between 7 and 24 percent over the No Build Alternative, depending on the station area cluster. In addition to these travel time savings, the extended transit service hours (20 hours per day, Monday through Friday) would be another substantial transit benefit, particularly to transit users who work outside the typical 8:00 a.m. to 5:00 p.m. work day and may be faced with limited bus schedules.

TABLE C-4
Transit Travel Time Savings Benefits of Select East Link Alternatives by 2030[a]

Segment E, Downtown Redmond				
SE Redmond	66	50	16	24
Redmond Town Center	70	56	14	20
Downtown Redmond	71	58	13	18
Redmond Transit Center	71	61	10	14

[a] Travel time is a composite of all modes of transportation (i.e., auto, bus, walking, bicycle, light rail) used to complete the trip from door to door.

As described in Section C.6.1, these benefits are particularly important to low-income populations as well as minority populations, who tend to make greater use of transit than other groups.

C.6.3 Improved Access to Employment

With the improvements in travel times, users of East Link would be able to travel longer distances in the same amount of time, which could provide new employment opportunities. This benefit is particularly important for the transit-dependent populations that cannot use the bus to access many areas in the project vicinity because of the extended travel times or bus routes that do not serve their destinations well.

Because the East Link Project is expected to improve travel times over the No Build Alternative, users of East Link would have the opportunity to look for employment in areas that were previously considered too time-consuming or difficult to reach. The East Link Project would also provide reliable connections to the large employment centers of Seattle and Bellevue.

C.7 Conclusion

As described above, the East Link Project would not result in any effects that would be considered high and adverse under EO 12898 and the DOT Order. For the most part, project impacts would be limited in scope and others would be mitigated through the implementation of effective mitigation measures. Because the project would not result in disproportionately high and adverse effects, further analysis of the minority and income characteristics of effected populations is not warranted.

The East Link Project would provide substantial benefits that would positively affect minority and low-income populations in the areas surrounding the light rail stations. These benefits include improved access to transit; a safer, more reliable, and more efficient transportation system; improved mobility through the project vicinity; transit travel time savings; improved accessibility to employment; and extended transit service hours. These offsetting benefits further support the conclusion that the East Link Project would not result in disproportionately high and adverse effects as defined in EO 12898 or the DOT Order.

Appendix D

Section 4(f)/6(f) Evaluation

D.1 Introduction

This appendix provides documentation necessary to support determinations required to comply with the provisions of United States Code (USC), Title 49, Section 303 (hereinafter referred to as "Section 4(f)") and the Land and Water Conservation Fund (LWCF) Act of 1965 (hereinafter referred to as "Section 6(f)"). Section 4(f) properties are publicly owned lands of a park, recreation area, or wildlife and waterfowl refuge or land of a historical site of national, state, or local significance as determined by the federal, state, regional, or local officials having jurisdiction over the resource. Section 6(f) properties are recreation resources funded by the LWCF Act. Land purchased with these funds cannot be converted to a nonrecreation use without coordination with the National Park Service (NPS) and mitigation that includes replacing the quality and quantity of land used. Converting any portion of these lands follow Code of Federal Regulations, Title 36, Section 59.3 of the Land and Water Conservation Fund Program. This appendix addresses impacts, mitigation and avoidance alternatives on Section 4(f) resources followed by similar discussion on Section 6(f) resources. Section 6(f) regulations and procedures are described in more detail beginning in Section D.6 of this appendix.

Only those Section 4(f) or Section 6(f) resources that are potentially impacted by East Link are addressed in this analysis. Information on publicly owned parklands, recreation lands, wildlife and waterfowl refuges, and historic sites is provided in Section 4.17, Parkland and Open Space; Section 3.16, Historic and Archaeological Resources; and Appendix H4, *East Link Project Historic and Archaeological Resources Technical Report*.

Code of Federal Regulations (CFR), Title 23, Part 774, which directs the use of Section 4(f) resources, as amended March 2008, states the following:

> "*The Administration may not approve the use of publicly owned land of a public park, recreation area, or wildlife and waterfowl refuge of national, state, or local significance, or land of an historic site of national, state, or local significance (as determined by the federal, state, or local officials having jurisdiction over the park, area, refuge or site), unless a determination is made under paragraph (a) or (b) as follows:*
>
> *(a) The Administration determines that:*
>
> *(1) There is no feasible and prudent avoidance alternative to the use of land from the property; and*
>
> *(2) The action includes all possible planning to minimize harm to the property resulting from such use; or*
>
> *(b) The Administration determines that the use of the property, including any measure(s) to minimize harm (such as any avoidance, minimization, mitigation, or enhancement measures) committed to by the applicant, will have a de minimis impact on the property.*
>
> *(c) If the analysis concludes that there is no feasible and prudent avoidance alternative, then the Administration may approve only the alternative that causes the least overall harm in light of the statute's preservation purpose.*"

The proposed East Link Project, which is evaluated in this Environmental Impact Statement (EIS), is a transportation project that might receive federal funding and/or discretionary approvals through the U.S. Department of Transportation (USDOT) (e.g., Federal Transit Administration [FTA]); therefore, documentation of compliance with Section 4(f) is required. In addition, this evaluation incorporates Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), Publication L, 109-59. This act amended existing Section 4(f) legislation at 138 USC 23 and 303 USC 49 to simplify the processing and approval of projects that have only *de minimis* impacts on properties protected by Section 4(f). For the East Link Project, FTA is the lead federal agency for USDOT, which makes the final determination on *de minimis* for a particular resource.

A finding of *de minimis* may occur when all possible planning to minimize harm by reducing the impacts on the Section 4(f) property to *a de minimis* level such that the impact does not result in an adverse effect [23 CFR §774.2(b)]. When a finding of *de minimis* can be reached, an analysis of feasible and prudent avoidance alternatives is not required (23 CFR §774.17). The following criteria must be met to conclude a *de minimis* finding:

- For parks, recreation areas, and wildlife and waterfowl refuges, a *de minimis* finding may be made only if the following apply [23 CFR § 774.5(b)]:

  - Public notice and an opportunity for public review and comment concerning the effects on the protected activities, features, or attributes of the property must be provided. This requirement can be satisfied in conjunction with other public involvement procedures, such as a comment period provided on a National Environmental Policy Act (NEPA) document.
  - The Administration shall inform the official(s) with jurisdiction of its intent to make a *de minimis* impact finding. Following an opportunity for public review and comment as described in paragraph (b)(2)(i) of this section, the official(s) with jurisdiction over the Section 4(f) resource must concur in writing that the project will not adversely affect the activities, features, or attributes that make the property eligible for Section 4(f) protection.

- For a historic site, a *de minimis* finding might be made only if, in accordance with the Section 106 process of the National Historic Preservation Act of 1966 (NHPA) and written concurrence from the State Historic Preservation Officer (SHPO) or Tribal Historic Preservation Officer (THPO) and from the Advisory Council on Historic Preservation (ACHP), it is found that the transportation program or project will have no impact or no adverse impact on historic properties. FTA shall inform these officials of its intent to make a *de minimis* impact determination based on their concurrence in the finding of "no adverse effect" or "no historic properties affected."

Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. In this Final EIS, Section 4.16 documents and Appendix H4, the *East Link Project Historic and Archaeological Resources Technical Report* documents these resources, project effects, and mitigation measures. According to 36 CFR 800 (Section 800.5(a)(1)), the criterion for an adverse effect triggering the Section 106 process is as follows:

> *"An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling or association."*

Pursuant to 36CFR 800.5(b), an agency may include impact minimization measures as a condition of the project to avoid an adverse effect:

> *"The agency official, in consultation with the SHPO/THPO, may propose a finding of no adverse effect when the undertaking's effects do not meet the criteria of paragraph (a)(1) of this section or the undertaking is modified or conditions are imposed, such as the subsequent review of plans for rehabilitation by the SHPO/THPO to ensure consistency with the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68) and applicable guidelines, to avoid adverse effects."*

The evaluation presented in this Section 4(f)/6(f) Evaluation accomplishes the following:

- Identifies Section 4(f) and Section 6(f) resources (Section 6(f) is discussed in Section D.7) along the East Link Project alternative routes, stations, and maintenance facilities
- Discusses how the project elements would affect the resources
- Lists impacted Section 4(f) resources that would qualify for a *de minimis* finding
- Determines whether there are feasible and prudent alternatives that avoid the use of Section 4(f) properties;
- Identifies potential measures that should be considered to minimize harm resulting from unavoidable adverse impacts on Section 4(f) properties; and
- Presents an overall least harm analysis.

The evaluation also documents Sound Transit's and FTA's consultation with public agencies that have jurisdiction over the Section 4(f) and 6(f) properties.

D.2 Proposed Action

The proposed action is to expand the Sound Transit Link light rail system from Seattle to Mercer Island, Bellevue, and Redmond via Interstate 90 (I-90) to provide a reliable and efficient transportation mode for moving people throughout the region.

This Section 4(f)/6(f) Evaluation was prepared in conjunction with the East Link Project Final EIS. The Final EIS Chapter 1, Purpose and Need, and Chapter 2, Alternatives Considered, provide the complete description of the proposed action, and Chapter 2 also illustrates the alternatives considered in this report. Sections 4.16 and 4.17 of the Final EIS describe the historic properties and park and recreational resources in the study area, respectively. Finally, Exhibit D-1 in this Section 4(f)/6(f) Evaluation (see Section D.4.1) depicts the location of the Section 4(f)/6(f) facilities, and Appendix H4, *East Link Project Historic and Archaeological Technical Report,* of the Final EIS shows the location of resources eligible for the National Register of Historic Places (NRHP).

D.3 Definition of Section 4(f) "Use"

Per 23 CFR 774.11, Section 4(f) applies only to those portions of such lands which function for, or are designated in the plans of the administering agency as being for, significant park, recreation, or wildlife and waterfowl refuge purposes as determined by the official(s) with jurisdiction over the Section 4(f) resource. The Section 4(f) requirements apply to historic sites (both structures as well as archaeology sites) on or eligible for the National Register and those portions of the U.S. Interstate System formally identified by Federal Highway Administration (FHWA) for Section 4(f) protection based on national or exceptional historic significance. Impacts on Section 4(f) resources, or properties, occur when there is a "use" of the properties. Such impacts can consist of either a direct or a constructive use of the properties, as defined in the following subsections. The 4(f) resource must be publicly owned at the point at which "use" occurs. As defined in 23 CFR 774.17, the "use" of a protected Section 4(f) resource occurs when one or more of the following occur:

- Land is permanently incorporated into a transportation facility (e.g., "direct use")
- There is a temporary occupancy of land that is adverse in terms of the preservationist purposes (e.g., "temporary use")
- There is no permanent incorporation of land, but the proximity of a transportation facility results in impacts so severe that the protected activities, features, or attributes that qualify a resource for protection under Section 4(f) are substantially impaired (e.g., "constructive use")

D.3.1 Direct Use

A direct use of a Section 4(f) resource takes place when property is permanently incorporated into a proposed transportation facility (23 CFR 774.17). This might occur as a result of partial or full acquisition, permanent easements, or temporary easements that exceed regulatory limits noted in Section D.3.2.

D.3.2 Temporary Use

A temporary use of a Section 4(f) resource occurs when the property is temporarily occupied and that occupancy is considered adverse in terms of the preservationist purposes of the Section 4(f) statute. Under the FTA/FHWA regulations (23 CFR 774.13[d]), a temporary occupancy of property does not constitute a use of a Section 4(f) resource when the following conditions are satisfied:

- The occupancy must be of temporary duration (e.g., shorter than the period of construction) and must not involve a change in ownership of the property.
- The scope of work must be minor, with only minimal changes to the protected resource.
- There must be no permanent adverse physical impacts on the protected resource or temporary or permanent interference with activities or purpose of the resource.
- The property being used must be fully restored to a condition that is at least as good as existed prior to the proposed project.
- There must be documented agreement of the appropriate officials having jurisdiction over the resource regarding the foregoing requirements.

D.3.3 Constructive Use

A constructive use of a Section 4(f) resource occurs when a transportation project does not permanently incorporate land from the resource, but the project's proximity results in impacts (e.g., noise, vibration, visual, access, and/or ecological impacts) so severe that the protected activities, features, or attributes that qualify the resource for protection under Section 4(f) are substantially impaired (23 CFR 774.15). Substantial impairment occurs only if the protected activities, features, or attributes of the resource are substantially diminished. A "*constructive use*" test to determine whether the resources are substantially diminished as defined in 23 CFR 771.135(p)(6) and summarized as:

- Identifying the current activities, features, or attributes of the resource that might be sensitive to proximity impacts
- Analyzing whether the potential proximity impacts on the protected Section 4(f) resource per 23 CFR 771.135(p)(4) and (5): the noise level increase attributable to the project substantially interferes with the use and enjoyment of the noise-sensitive facility; the esthetic features or attributes of the resource are diminished (obstructs or eliminates primary views of the buildings), restrictions in access diminish the utility of the resource; or the vibration impact substantially diminishes the use of the resource
- Consulting with the appropriate officials having jurisdiction over the resource

East Link Project

D.4 Impacts on Section 4(f) Resources

D.4.1 Range of Potential Impacts

Section 4.17, Parkland and Open Space, and Appendix F4.17 of the Final EIS provides information on the parks within the East Link Project study area. No designated wildlife and waterfowl refuges exist in the study area. FTA, with concurrence from the SHPO in the Department of Archaeology and Historic Preservation (DAHP), found the following resources eligible for the NRHP in the study area: Pilgrim Lutheran Church, the Surrey Downs potential historic district, the Safeway Store, the Former Bellevue Fire Station, the Justice White House, and the Bill Brown Saloon. Additional resources include U.S. Immigration Station and Assay Office Building (INS Building), the Publix Hotel (contributor to the China Town Historic District), the Jose Rizal 12th Avenue South Bridge, the Will H. Thompson House, the Lake Washington Segment of I-90 (including the Mount Baker Ridge Tunnel and Eastern Portals), and the Winters House.

Table D-1 lists the park resources and properties on or eligible for the NRHP that would be potentially affected by project alternatives, either directly or as a result of proximity impacts and construction impacts and, thus, are afforded protection under Section 4(f) regulations. The range of potential impacts on Section 4(f) resources from the build alternatives follows:

- Acquisition of portions of specific Section 4(f) properties
- Long-term proximity impacts on some of these properties, none of which result in a "constructive use"
- Temporary construction impacts

Some of the properties discussed in Section 4.17 of the EIS are not discussed in this Section 4(f)/6(f) Evaluation because, pursuant to Section 4(f) regulations, they are not considered to be a significant resource as determined by the local jurisdiction (e.g., Bellevue Way SE Greenbelt), they are not publicly owned (e.g., Town Center Open Space), or their primary purpose has been identified to be other than Section 4(f) purposes (e.g., I-90 Trail, landscaped areas of Park on the Lid). Section 4.16 and 4.17 include exhibits illustrating the area of impacts for each historic and park resource, respectively. Table D-1 provides an overview of the potential impacts on each resource, mitigation proposed, and the preliminary 4(f) findings after mitigation, and Exhibit D-1 shows the location of the 4(f) properties. FTA and Sound Transit have consulted with officials who have jurisdiction over the resources and Section D.8, Record of Coordination, provides more detail. These officials have submitted letters reflecting their views regarding impacts to Section 4(f) resources in their respective jurisdictions (see Attachment D1 at the back of this Section 4(f)/6(f) Evaluation).

FTA in consultation with SHPO, has made a determination of Adverse Effect for the project under Section 106, resulting from potential impacts on the Winters House (*Preferred Alternative B2M*) and the potential Surrey Downs Historic District (*Preferred Alternative C11A*). In addition, the potential Surrey Downs Historic District would be impacted by Alternatives C4A, C2T, and C3T) and the Justice White House (Alternative E4).

Based on the analysis of park impacts presented, the determination of effect to historic resources, and coordination with officials having jurisdiction, FTA has made a determination of *de minimis* finding for the 4(f) resources in the study area for all other project alternatives and design options under the jurisdiction of the City of Seattle, City of Mercer Island, City of Redmond, and King County. Correspondence documenting the jurisdiction's concurrence is attached in the back of this Section 4(f)/6(f) Evaluation. A *de minimis* determination has not been made for park resources under the jurisdiction of the City of Bellevue. The following subsections describe the impacts of the alternatives by segment. This Section 4(f)/6(f) Evaluation does not provide any further discussion for resources that have no use from any of the East Link Project alternatives.

D.4.2 Potential Impacts of Project Alternatives

All East Link Project Alternatives in Segments A, B, C, and E, with the exception of Alternatives C7E and C14E, come in contact with Section 4(f) resources either during project construction and/or during operation. No park or recreational resources are located in Segment D, but there is one historic resource located along Alternative D3.

D.4.2.1 Segment A

There are three potential Section 4(f) uses within Segment A. The Lake Washington Highway Segment of I-90 has been determined eligible for the National Register since the 2008 Draft EIS was published and is discussed below. Benvenuto Viewpoint in Seattle is a 4(f) resource in Segment A along I-90. Last, if the pedestrian bridge option is included at the Mercer Island Station, then the Outdoor Sculpture Gallery would also be impacted.

TABLE D-1
Impacts and Mitigation Measures for Section 4(f) Resources

Facility (size)	Impact	Mitigation	Associated Alternative	*De Minimis,* Use, or No Use
Parks				
Segment A				
Benvenuto Viewpoint (1.7 acres)	**Permanent:** Less than 0.1 acre acquired **Temporary:** Construction impacts[a]	**Permanent:** ▪ Design station entrance to be compatible with the City's park design. **Temporary:** ▪ Restore temporarily disturbed area to existing conditions.	*Preferred Alternative A1*	*de minimis*
Outdoor Sculpture Gallery (1.6 acre)	**Permanent:** 0.3 acre acquired with the pedestrian bridge only (option not included in the *Preferred Alternative*) **Temporary:** Construction impacts[a] Partial closure during construction	**Permanent:** ▪ Design station entrance to be compatible with the surrounding the park. **Temporary:** ▪ Restore temporarily disturbed area to existing conditions.	A1 - Mercer Pedestrian Bridge Design Option	*de minimis*
Segment B				
Mercer Slough Nature Park **(320 acres)**	**Permanent:** Up to 3.0 acre converted to light rail use (a portion of which is aerial easement) Vehicular access to Sweylocken boat ramp modified right-in/right-out Trails relocated Vehicular access to Winters House and blueberry farm combined **Temporary:** 3.6 acres disturbed Construction impacts[a] Parking at Winters House and blueberry farm closed Winters House and blueberry farm retail closed Trails and access points closed	**Permanent:** ▪ Acquire replacement land pursuant to Washington State Recreation and Conservation Office (RCO) and Section 6(f) requirements that would be consistent with the natural character of the park. ▪ Have an option to preserve existing vehicle access to Sweylocken boat ramp. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Provide temporary parking for users off Bellevue Way and south of the park-and-ride or as agreed to with the City. ▪ Relocate blueberry farm retail use during construction. ▪ Maintain blueberry farm operations. ▪ Relocate Eastside Heritage Center during construction. ▪ Maintain access or provide detours for trails, and maintain access to Sweylocken boat ramp.	*Preferred Alternative B2M*	Use
	Permanent: 0.5 to 1.7 acres converted (includes aerial easements) **Temporary:** 1.7 to 2.6 acres disturbed Construction impacts[a] Certain trail access points closed Access to boat launch revised (Alternative B1 only)	**Permanent:** ▪ Acquire replacement land pursuant to RCO and Section 6(f) requirements or provide financial compensation as agreed with the City. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Maintain access or provide detours for trails, and maintain access to Winters House, blueberry farm, and boat launch where affected as agreed to with the City. ▪ Provide new signal for full access to boat launch (Alternative B1 only).	All other Segment B Alternatives	Use

Facility (size)	Impact	Mitigation	Associated Alternative	*De Minimis,* Use, or No Use
Segment C				
Potential Surrey Downs Historic District	**Permanent:** Potential noise impacts **Temporary:** Construction impacts[a]	**Permanent:** ▪ Install a permanent sound barrier along the south side of the guideway along Main Street to prevent noise impacts on contributing properties in the potential Surrey Downs Historic District. ▪ Landscape along south side of the guideway and the 108th Station along Main Street to enhance the neighborhood boundary where non-contributing properties are removed. **Temporary:** ▪ Typical BMPs to minimize and avoid construction impact would be applied. ▪ Before construction begins, install a solid construction barrier along contributing properties south of Main Street. ▪ Where possible, preserve the evergreen trees along the south edge of the proposed station area, east of 108th Avenue SE.	*Preferred Alternative C11A*	No constructive use
	Temporary: Construction impacts[a]	**Temporary:** ▪ Typical BMPs to minimize and avoid construction impact would be applied. ▪ Before construction begins, install a solid construction barrier along contributing properties south of Main Street.	Alternatives C2T and C3T	No constructive use
	Permanent: Potential noise impacts **Temporary:** Construction impacts[a]	**Permanent:** ▪ Install a permanent sound barrier along the south side of the guideway along Main Street next to contributing properties. ▪ Landscape along the south side of the guideway along Main Street to enhance the neighborhood boundary where noncontributing properties are removed. **Temporary:** ▪ Typical BMPs to minimize and avoid construction impact would be applied. ▪ Before construction begins, install a solid construction barrier along contributing properties south of Main Street. ▪ Where possible, preserve the evergreen trees along the south edge of the proposed station area, east of 108th Avenue SE.	Alternative C4A	No constructive use
Pilgrim Lutheran Church	**Permanent:** Use of 0.03 acre of property; no impacts on the church **Temporary:** Construction impacts[a]	**Permanent:** ▪ Avoid stormwater vault maintenance during church services and special events to the extent possible. ▪ Minimize parking space obstruction during stormwater vault maintenance. **Temporary:** ▪ Typical BMPs to minimize and avoid construction impact would be applied. ▪ Avoid construction during church services and special events to the extent possible. ▪ Restore disturbed areas following construction.	Alternative B1	*De minimis*

TABLE D-1 CONTINUED
Impacts and Mitigation Measures for Section 4(f) Resources

Facility (size)	Impact	Mitigation	Associated Alternative	*De Minimis,* Use, or No Use
Safeway	**Permanent:** Alignment would travel underground on the property, approximately 170 feet from the building No impacts on the Safeway store **Temporary:** Construction impacts[a]	**Temporary:** ▪ Typical BMPs to minimize and avoid construction impact would be applied. ▪ Restore disturbed areas following construction.	Alternative C1T	*De minimis*
Segment D				
Former Bellevue Fire Station	**Permanent** Use of narrow section of parcel along Bel-Red Road for widening road for retained cut No impacts on the building **Temporary:** Construction impacts [a]	**Temporary:** ▪ Typical BMPs to minimize and avoid construction impact would be applied. ▪ Restore disturbed areas following construction.	Alternative D3	*De minimis*
Segment E				
Justice White House	**Permanent:** Building relocated	▪ Consult with SHPO to determine whether an appropriate location can be found to relocate this resource. If such a location can be determined, FTA and Sound Transit would consult with SHPO, the City of Redmond, and other interested parties to develop and to determine a suitable relocation site that preserves the Justice William White House's setting, feeling, and association with the railroad, thus maintaining its eligibility for the NRHP. The relocation would be managed by qualified architects and engineers in a manner to avoid damage to the building and preserve its eligibility for listing in the NRHP. Prior to relocating the building, Sound Transit would fully record the building in its original context through a Level II Historic American Building Survey/Historic American Engineering Record documentation. This would include photographs, measured drawings, and a written history component. If alternative E4 were selected, then the MOA would be altered to include mitigation for the Justice William White House.	Alternative E4	Use

[a] Construction impacts might include impacts such as removed landscape, dust, noise, and/or traffic detours. For historic properties, the setting might be temporarily changed.

[b] Impacts to this trail for Preferred Alternative E2, and E2-Transit Center Design Option are zero since the impacted acreage is counted under impacts to Marymoor Park.

The I-90 Trail is a pedestrian and bicycle path that parallels the freeway. FHWA has determined this is a transportation facility rather than a recreational resource and, therefore, would not be a Section 4(f) resource. Also, much of the I-90 Parks on the Lid are determined to be a part of the I-90 freeway and not Section 4(f) resources.

Interstate 90

The Lake Washington Highway Segment of I-90 from milepost 3.4 to 8.9, from the west end of the Martin Luther King, Jr. Way Lid to the east end of the East Channel Lake Washington Bridges, was determined eligible for the National Register by the Washington State Department of Transportation (WSDOT), on behalf of FHWA, under Criteria A and C and Criteria Consideration G. DAHP concurred with this determination in its letter dated November 23, 2009. This segment of I-90 is just over 5 miles long and includes the roadway, with character-defining features such as lids, bridges, tunnels, ramps, noise walls, overcrossings, and undercrossings (shown in Exhibits D-2 and D-3). Major character-defining features include the Mount Baker Ridge Tunnels; the Lacey V. Murrow and Homer M. Hadley floating bridges; the East Channel Lake Washington Bridges; the Martin Luther King Lid; the First Hill Lid; and the Luther Burbank Lid. The lids have pedestrian and bicycle paths, extensive landscaping, and park areas. During the planning of the Homer M. Hadley floating bridges, extensive community and agency planning process resulted in a Memorandum Agreement (MA) in 1976 that included planning for high-capacity transit in the center roadway.

Preferred Interstate Alternative (A1) would fulfill the MA. *Preferred Alternative A1* would use the I-90 center roadway for the light rail guideway and includes a station in the center of I-90 between Rainier and 23rd Avenues South, with entrances from 23rd and Rainier Avenues South, and a station with the existing park-and-ride garage on Mercer Island between 77th and 80th Avenues SE with station entrances on 77th and 80th Avenues SE. Both I-90 tunnels and the floating bridge would need to be modified to incorporate light rail, including changes to wall dividers, drainage, tunnel ventilation, and the addition of rails and the overhead catenary system. To equalize weight on the bridge from installing the steel rail, the concrete surface might be made thinner by removing the upper layers. To accommodate movement of the floating bridge in relation to the land abutment, a specialized rail expansion joint would be installed on the bridge. Converting the center roadway to light rail would require closing the westbound 77th Avenue SE off-ramp and modifying other ramps.

EXHIBIT D-2
Mount Baker Ridge Tunnel

EXHIBIT D-3
I-90 Lake Washington Highway Segment

Project operation would not affect the I-90 Lake Washington portion of Segment A or its character-defining features, including the portals of the Mount Baker Ridge Tunnels. This segment of I-90 is unique in including both highway and transit elements in its earliest planning stages, unlike most of the national interstate system. There would not be an impact from the East Link Project on the resource and its character-defining features because of its original design to accommodate high-capacity transit, including light rail, and because the design of the proposed light rail project protects and preserves character-defining features. All construction activities would be located within the center of I-90. No character-defining features would be altered or removed by project construction or operation, and construction would not affect the property in a manner that would impair future use of the resource as it was intended.

Benvenuto Viewpoint

The Preferred Alternative A1 would construct the Rainier Station within the center lanes of I-90, west of and below 23rd Avenue South. I-90 is an eight-lane freeway in this location. A pedestrian plaza consisting of ticket vending, escalators, elevator, and stairs to the station would be constructed on 23rd Avenue South in a landscaping strip connecting to Benvenuto Viewpoint. The pedestrian plaza would acquire and directly use less than 0.1 acre of a landscaping strip, or less than 5 percent of the total area of the 4(f) resource. The portion of Benvenuto Viewpoint used as a viewpoint would not experience a change in view. Although the Rainier Station and entrance could be seen from the viewpoint, the station would be consistent with the current transportation-oriented nature of the area, and the views to the west and south would be unaffected. Given the location of the route and station in the center lanes of I-90, no additional noise impacts are anticipated in the 4(f) resource. During construction, the landscaped strip of Benvenuto Viewpoint would likely be removed. A detour would be provided during construction allowing for continued access to the viewpoint. Last, there is no difference in nonpreferred Alternative A1 design options that would change the effects to the I-90 eligible structure.

Outdoor Sculpture Gallery

Preferred Alternative A1

No impact would occur on the Outdoor Sculpture Gallery from *Preferred Alternative A1*.

Alternative A1 Design Options

At the Mercer Island Station, a design option to connect the center platform station on I-90 to the Outdoor Sculpture Gallery via a pedestrian bridge over the eastbound lanes of I-90 is being considered but is not the preferred alternative. Approximately 0.3 acre of property acquisition would occur to accommodate this bridge and the pedestrian plaza, which would consist of ticket vending and information. This connection would allow a more direct connection into Mercer Island's downtown core. During the construction of this option, a portion of the Outdoor Sculpture Gallery would likely close. A detour would be provided during construction allowing for continued access to other portions of the gallery.

D.4.2.2 Segment B

Three 4(f) resources might be impacted by Segment B alternatives: Mercer Slough Nature Park, Winters House, and Pilgrim Lutheran Church. These impacts are discussed below. The City of Bellevue has determined that the Greenbelt Open Space at the intersection of Bellevue Way and 112th Avenue SE is not a significant park resource and, therefore, not a Section 4(f) resource.

Mercer Slough Nature Park

Preferred 112th SE Modified Alternative (B2M)

Preferred Alternative B2M would follow the length of the western edge of Mercer Slough Nature Park, east of Bellevue Way SE. This area of the park includes wetland and upland habitat, the blueberry farm, fruit and vegetable produce sales, trailheads, a trailered boat launch ramp, the NRHP-listed Winters House, and parking for the blueberry farm and Winters House. Park users in this area include walkers and joggers along the Periphery Loop Trail sidewalk, those accessing the blueberry farm and Winters House, and those accessing the park's interior trails. A 0.2-mile section of the Heritage Loop Trail parallels Bellevue Way SE below the roadway level. Bellevue Way SE, a principal arterial connecting I-90 to Downtown Bellevue, is a prominent element along the edge of the park. The impacted area is not important for wildlife viewing due to disturbance from the adjacent roadway and the South Bellevue Park-and-Ride and active use of the area for the blueberry farm, Winters House, and trail access. *Preferred Alternative B2M* would permanently use 2.9 acres when connecting to *Preferred Alternative C11A* and 3.0 acres when connecting to *Preferred Alternative C9T*, which is less than 1 percent of the 320-acre 4(f) resource (Table D-2). At the south end of Mercer Slough Nature Park where the alternative is elevated, approximately 1.4 acres could still be used for recreational purposes in those areas where there is sufficient clearance.

TABLE D-2
Impacts on Mercer Slough Nature Park

Alternative		Operation Impact Area (acres)	Construction Impact Area (acres)
Preferred Alternative B2M	Connecting to *Preferred Alternative C11A*	2.9	3.6
	Connecting to *Preferred Alternative C9T*	3.0	
Alternative B1		0.5	2.6
Alternative B2A		1.7	2.5
Alternative B2E		0.7	1.8
Alternative B3		1.7	2.5
B3 - 114th Design Option		1.7	2.6
Alternative B7		0.9	1.7

This alternative would acquire an approximately 30- to 50-foot width of the Mercer Slough Nature Park's western boundary for approximately 3,200 feet, removing shrubs and trees. This alternative would relocate and consolidate some vehicle and pedestrian access points on the park's west side and the South Bellevue Station would improve park access. Exhibit D-4 depicts the impacted park area and trail and driveway relocations.

The existing blueberry farm driveway would be removed and combined with the Winters House driveway via a new access road to the north, and the section of the Heritage Loop Trail along Bellevue Way would be restored to the east. The project would remove two existing pedestrian connections from Bellevue Way SE to the park, one at the existing blueberry farm driveway and one south of the Winters House parking lot, which would be reconstructed. The pedestrian access north of the Winters House would be relocated slightly south. Although the number of access points would be reduced, the park and its components would remain accessible from various points along Bellevue Way for both vehicles and pedestrians.

In addition, consolidating the access points might be considered a benefit to the park by removing one vehicle crossing of the Periphery Loop Trail and consolidating active use since the City of Bellevue's goals and objectives are to enhance the wetland nature and passive uses of the park. Access to the Sweylocken boat ramp would become right-in/right-out only.

The boat ramp would no longer be accessible from southbound Bellevue Way; however, there is a design option that would maintain the current access allowing left-hand turn movements to the boat launch. Without the design option, users would need to travel to I-90 via SE 8th Street and I-405 to access to launch. The I-90 Trail, and other Mercer Slough Nature Park trails would not be affected.

As described Final EIS Section 4.7, Noise and Vibration, existing noise levels in Mercer Slough Nature Park are affected by the major arterial, Bellevue Way SE, and the two interstate highways (I-90 and I-405) that border the park. The active areas on the western edge of the park including the boat launch, blueberry farm, and Winters House, are not considered noise-sensitive, but the interior areas of the park meet the FTA criteria for noise-sensitive areas. Light rail noise levels from operation of *Preferred Alternatives C11A* or *C9T* connecting to *Preferred Alternative B2M* are predicted to be lower than the existing noise levels by 3 dBA Leq or more at active and noise-sensitive locations within the park. Also the project noise levels in the interior noise-sensitive areas of the park would be well under the FTA noise impact criteria.

The project would not be seen in most parts of the Mercer Slough Nature Park due to the project's low profile and existing vegetation. Given the presence of trees and large shrubs throughout much of the park, removing vegetation along the alignment would not be noticed in most areas. Removing trees in the construction right-of-way east of Bellevue Way SE and 112th Avenue SE and other street trees would be noticeable from the Periphery Loop Trail (which in this area is the sidewalk adjacent to Bellevue Way SE and 112th Avenue SE) and a portion of the water trail in Mercer Slough West. Operating *Preferred Alternative B2M* would not substantially affect park use; diminish the park's value; or impair the park's activities, features, and attributes.

Construction activities associated with *Preferred Alternative B2M* would encroach into Mercer Slough Nature Park and would require a temporary construction easement of approximately 3.6 acres when connecting with *Preferred Alternative C11A* or *Preferred Alternative C9T*. After construction, these areas would be restored with appropriate native vegetation. Utility relocation and light rail construction in the western edge of Mercer Slough Nature Park would result in increased noise, dust, and temporary access restrictions to western areas of the park.

During construction, the Periphery Loop Trail and sidewalk on the eastern side of Bellevue Way SE would likely close and require detours. Construction along 112th Avenue SE could result in increased noise and dust near the water trail but is not expected to inhibit normal trail use because this is a short section currently characterized by the existing roadway. Construction would close the Winters House temporarily and temporarily relocate the Eastside Heritage Center offices, their files, and services located within the Winters House. The City of Bellevue would not receive rental income from the Winters House during construction. Construction activities would close adjacent parking to the Winters House and the blueberry farm's retail component. The blueberry farm's retail would be relocated to allow the business to continue operation during construction. Farming operations would be maintained during construction, but there would be no public access. Closing parking at the Winters House and closing the South Bellevue Park-and-Ride would reduce available parking on the western side of the park, but other parking accommodations would be made available as well as signage to redirect users to accessible areas. Park users would need to use the existing parking at the boat

launch and on the eastern side of the park or temporary parking which would be provided off Bellevue Way. There would be no access to the trails located north of the South Bellevue Park-and-Ride, but access would be maintained during construction to the trails located south through detours. Construction would not inhibit normal use and access points on the east side of the park. Constructing *Preferred Alternative B2M* would not substantially affect park use or diminish its value due to the project's location along the park's boundary with Bellevue Way SE.

Other Segment B Alternatives

All Segment B alternatives would affect the Mercer Slough Nature Park to varying degrees. Similar to *Preferred Alternative B2M*, Alternatives B1, B2A, B2E, B3, and B3 - 114th Design Option would provide enhanced accessibility to the Mercer Slough Nature Park by locating a station at the South Bellevue Park-and-Ride. They also would acquire long, narrow, and intermittent portions of this park's western boundary and thereby remove some shrubs and trees, although less area would be acquired compared with *Preferred Alternative B2M* (Exhibit D-5). Of these alternatives, Alternative B2A would require the most acquisition and Alternative B1 the least. The current at-grade Bellevue Way-to-I-90 connection for Alternative B1, however, would not be feasible with WSDOT's requirement to keep the high-occupancy vehicle (HOV) ramps open at that interchange. As a result, Alternative B1 would require an elevated connection over the ramps as in the other Segment B alternatives, and impacts to Mercer Slough Nature Park would increase similar to those alternatives.

Alternatives B2A, B2E, B3, and B3 - 114th Design Option would relocate a portion of the Heritage Farm Trail just east of its current location, between the South Bellevue Park-and-Ride and the Winters House. Access to the Sweylocken boat ramp from 113th Avenue SE would be improved under Alternative B1 because a signal would be installed at this intersection where none exists today. Alternatives B2A, B2E, B3, and B3 - 114th Design Option would be elevated at this location, and access to the Sweylocken boat ramp would be right-in/right-out. The boat ramp would no longer be accessible from southbound Bellevue Way; however, there is a design option that would maintain the current access allowing left-hand turn movements to the boat launch as with *Preferred Alternative B2M*. The I-90 Trail and other Mercer Slough Nature Park trails would not be impacted. The elevated structure would create some additional shading. As with *Preferred Alternative B2M*, the areas below the elevated section could still be available for recreational purposes.

Vegetation removal along Bellevue Way SE and/or the placement of piers for the elevated portions of the alternatives along the west side of Mercer Slough Nature Park would be seen and noticed by some park users but would not interfere with the use of the facility. Similar to the *Preferred Alternative B2M*, the SE 8th Station for Alternatives B2A and B2E would provide enhanced access to the Surrey Downs Park.

Alternative B7 would also impact Mercer Slough Nature Park. The 118th Station on Alternative B7 would provide new access to the east side of Mercer Slough Nature Park and the Mercer Slough Environmental Education Center. The elevated light rail structure would also be located along the south side of Mercer Slough Nature Park north of I-90 and the I-90 Trail. An easement or right-of-use would be needed to accommodate the elevated light rail structure. The area under the elevated structure would be revegetated and returned to park use, allowing access under the guideway and use of the I-90 Trail as it currently exists. As described in Section 4.5, Visual and Aesthetic Resources, the view from the park and trail would not be substantially affected by the new structure. Existing vegetation greatly reduces the amount of Mercer Slough Nature Park that can be seen from most parts of the trail and blocks views to the north. The elevated structure would be seen from the more open parts of the trail but would be screened by adjacent vegetation along other parts of the trail. The elevated structure would also create additional shading in the park.

This portion of the park, the I-90 Trail, as well as the Mercer Slough on the west side of the park near the I-90 off-ramps, would likely be intermittently closed to public access during construction of B7 for safety considerations. Once construction is completed, the area along the light rail elevated guideway would be revegetated and returned to parklands and the trail would remain unaltered. Wetland and other vegetation temporarily displaced by light rail construction, is expected to return to its current growth pattern within about 10 years.

For all nonpreferred alternatives except Alternative B7, reconstructing Bellevue Way SE and sidewalk adjacent to Mercer Slough Nature Park would increase noise and dust and temporarily restrict access to western areas of the park, although detours would be provided to maintain access to trails in this area. Construction is not expected to inhibit normal park use from other points of access. The blueberry farm, located inside the Mercer Slough Nature Park, would experience construction-related impacts under Alternatives B2A, B2E, B3, and B3 – 114th Design Option.

Exhibit D-5 **Affected Park Area Alternatives B1, B2A, B2E, B3, B3 114th Design Option, and B7 Segment B**

East Link Project

A portion of the entrance to the blueberry farm would need to be reconstructed to accommodate either the light rail structure or the shifted roadway closer to the farm.

Portions of the Mercer Slough Nature Park would be acquired as a temporary construction easement for use as a work area and access for construction. Table D-2 shows the approximate amount of construction area required under each alternative in Mercer Slough Nature Park. Although the park is close to existing noise generators (I-90 and Bellevue Way SE), temporary noise from East Link construction would be greater than is typical in this area.

Winters House

Preferred 112th SE Modified Alternative (B2M)

The Winters House, shown in Exhibit D-6, was listed in the NRHP in 1992 based on its Spanish Eclectic architecture and its association with developments in the bulb-growing and floriculture industry in King County and Washington State. Its period of significance spans from 1929 to 1941. Formerly a residence, the Eastside Heritage Center and the historical archive of the Eastside Heritage Center now occupy the building. The house also includes office space for Bellevue Parks staff, hosts community events and programs, and is a part of the Heritage Loop Trail. The NRHP registration form provides a boundary description that includes 50 feet of property around the house, including a portion of the property along Bellevue Way SE.

EXHIBIT D-6
Winters House, 2102 Bellevue Way SE (present)

The site of the house is bordered on the west by Bellevue Way SE, formerly a county road named Qualheim Road, which has been completely altered into a major arterial roadway that expanded toward the house and on the east by Mercer Slough. While the house's orientation to Bellevue Way at one time would have been a significant character-defining feature of the structure and its relationship to the surrounding landscape, the roadway's historic design—and, therefore, its relationship to the house –has lost its integrity. The undeveloped grounds' adjacent acreage is associated with the house. Although it is no longer cultivated and no intact outbuildings remain, the house does retain its setting and relationship to the surrounding undeveloped property that is now Mercer Slough Nature Park.

An analysis of the 50-foot designated boundary to determine whether any character-defining landscape features currently remain that convey the significance of the residence and its relationship to the landscape found no such features. Rather, the house's surrounding landscaping was found to have been altered substantially from the historic period of the residence (shown in Exhibit D-7). Except for some mature trees beyond the rear of the residence that once were part of the larger property, the current landscape features do not reflect the original landscape of the residence, nor do they convey the relationship of the landscape to the structure as it was first designed, matured, and allowed to evolve during the historic period of the property.

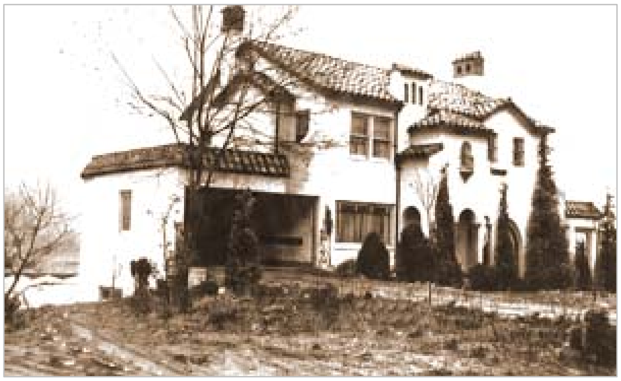

EXHIBIT D-7
Winters House, 2102 Bellevue Way SE (January 6, 1939)
(courtesy of Eastside Heritage Center)

Most plantings from the period of significance have been removed. Currently, the house consists of a landscaped lawn with a central concrete pathway featuring a center planting strip just opposite the entrance doors of the front elevation. The trees along the property's front and side elevations appear to be plantings from after the period of significance, including relatively new deciduous trees and decorative shrubs. The landscaping in no way reflects the original landscape, while the residence itself remains intact and fully conveys its significance and construction period and relationship to the surrounding undeveloped acreage once cultivated.

Exhibits D-8 and D-9 depict the bird's eye view and cross-section of the existing condition and for *Preferred Alternative B2M*. The guideway would be within a lidded retained cut within the 50-foot boundary for the property established by the NRHP nomination. The eastern edge of the lidded trench right-of-way for *Preferred Alternative B2M* is approximately 5 feet from the front entry and about 10 feet from the house proper. The perspective view and cross-section of *Preferred Alternative B2M* at the Winters House illustrate minimization approaches incorporated as conditions of the project to maintain historic integrity during light rail operation. These elements include placing the light rail in a 170-foot lidded retained cut in front of the structure, extending beyond the length of the 50-foot property boundary to the north and south of the house identified in the NRHP nomination, and installing landscaping that is sensitive to the historic period of the building and setting.

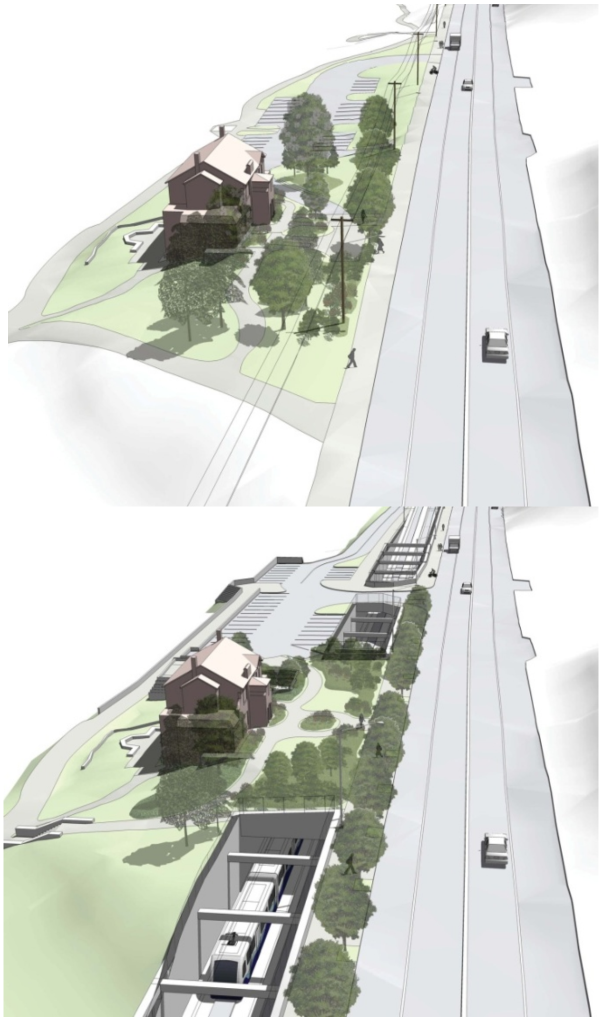

EXHIBIT D-8
Winters House Bird's Eye View: Existing Condition (top) and with *Preferred 112th SE Modified Alternative (B2M)* (bottom)

Bellevue Way SE would remain the same distance from the house. The project would shift the parking lot driveway approximately 90 feet north, with a lid over the light rail to allow vehicles to cross. The parking area would also be shifted slightly to the east. The relocated driveway and parking area would remain outside of the property's 50-foot boundary, and the number of spaces would remain the same. The parking area would also be raised in elevation, which would result in a visual change; however, the visual change in the parking area and associated ramps would not affect the setting of the historic resource because the existing parking lot was not present during the period of significance and does not contribute to the setting. In addition, replanted landscaping would further soften the appearance of the parking lot. Changes to the sidewalk would encroach 5 feet into the property and vehicular access to the garage of the house would not be maintained due to weight limitations on the lidded trench. Due to the proximity of the lidded retained cut and light rail guideway to the Winters House, the potential for settlement and vibration impacts during project operation and construction was analyzed and is described in Section 4.7.3 of the Final EIS.

During operation, a groundborne noise impact is projected at the Winters House. Standard methods of vibration reduction, such as using resilient fasteners or ballast mats, would be incorporated as conditions of the project and reduce the level of groundborne noise but might not eliminate the impact. Sound Transit will determine during final design whether a floating slab is necessary to address the groundborne noise impact. Vibration levels during operation are expected to be below the FTA impact criteria. In addition, the vibration levels are well below even the most stringent criteria for damage to structures.

The potential for damage from construction vibration and settlement due to the proximity of construction activity by the Winters House was evaluated. Given the period and type of the building, vibration and settlement minimization techniques, as described in Section D.5.2.1 below, have been incorporated as project conditions and will prevent damage or limit impacts to minor cosmetic damage, protecting the character-defining features of the former residence that convey its significance. Sound Transit would repair the building if damage were to occur. During construction, the Eastside Heritage Center offices would likely be relocated. In addition, the City of Bellevue would not receive rental income from the Winters House during construction. The Eastside Heritage Center and rental use would return to the building after construction. In addition, in consultation with the City, Sound Transit would replace the landscaping to more closely reflect

the landscaping of the historic period. New interpretive displays would also be installed on or near the property. As a result of these measures, the potential impacts to the Winters House are mitigated, while also benefitting the resource.

Other Segment B Alternatives

Alternatives B1, B2A, B3, and B3 - 114th Design Option would avoid impacts on the Winters House during project operation. While these alternatives encroach on the larger parcel on which the Winters House is located, no impact within the delineated historic boundary of the house would occur because these alternatives limit expansion of Bellevue Way to the existing right-of-way line at the Winters House. Alternatives B1 and B2A are located at-grade in the center of the roadway; and no visual, noise, or vibration impacts would result. Alternative B2E is elevated to the far side of Bellevue Way, away from the Winters House, also avoiding impacts on the property. Given its similar route and design to Alternative B2A, Alternative B3 and the B3 - 114th Design Option would also avoid impacts to the resource.

Pilgrim Lutheran Church

Preferred 112th SE Modified Alternative (B2M)

Preferred Alternative B2M would not impact the Pilgrim Lutheran Church.

Other Segment B Alternatives

Alternative B1 is not anticipated to impact the Pilgrim Lutheran Church, which is located just west of Bellevue Way (Exhibit D-10). This church building is eligible for the NRHP as an example of Neo-Expressionist architectural style; its eligibility does not include the property boundary. During construction, South Bellevue Way would be realigned up to 10 feet into the property for a distance of roughly 250 feet. The location already experiences the visual and noise effects of heavy street traffic. During construction, an underground stormwater detention vault would be installed under a portion of the northeast corner of the property and over 100 feet away from the Church building. Access from SE 11th Street to the church would not be disrupted from either project construction or operation. Following construction, all parking would be returned, and the vault would not be visible other than one or two manholes. Continued operation and maintenance of this stormwater vault would not impact the Pilgrim Lutheran Church. Maintenance would consist of periodically parking a truck at the site and opening the manholes for cleaning and maintenance, and maintenance could be scheduled to avoid major events and regular church services.

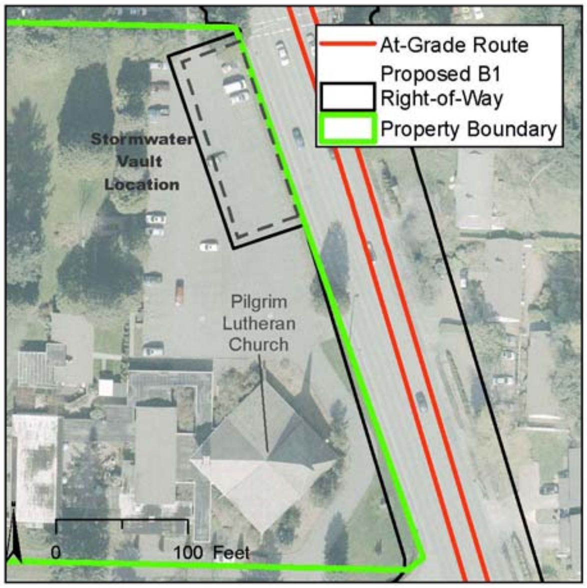

EXHIBIT D-10
Proximity of Alternative B1 to Pilgrim Lutheran Church

D.4.2.3 Segment C

Surrey Downs Park

Preferred 108th NE At-Grade Alternative (C11A)

Surrey Downs Park includes two athletic fields, a play structure, internal trails, open space, remnant stands of filbert or hazelnut trees, and the King County Courthouse and associated parking. Approximately 8.9 acres of the 11.4-acre site are currently used as park, with the remainder occupied by the King County Courthouse and parking. In March 2009, the City of Bellevue adopted a master plan for redeveloping the park, including the portion currently occupied by the King County District Courthouse. Proposed improvements include new baseball fields, open space, a community garden, parking, and a recreational building.

Preferred Alternative C11A could have potential impacts to Surrey Downs Park. Along 112th Avenue SE, *Preferred Alternative C11A* would acquire approximately 0.5 acre along the eastern edge of Surrey Downs Park for the light rail guideway (shown in Table D-3 and illustrated on Exhibit D-11). This area of the park is characterized by a steep slope and trees, a vehicle access at the southern and northern ends of the park, parking lots just west of the slope accessing the park facilities and the King County Courthouse building, a neighborhood pedestrian access point at the southeast corner of the park at 111th Avenue SE, and a pedestrian access from 112th Avenue SE at the park's northeast corner.

TABLE D-3
Segment C Alternatives Impact Area in Surrey Downs Park[a]

Alternative	Permanent (acres)	Temporary (acres)
Preferred Alternative C11A	0.5[a]	0.6[a]
Preferred Alternative C9T	0.5[a]	0.5[a]

EXHIBIT D-11
Preferred 108th NE At-Grade Alternative (C11A)
Surrey Downs Park Impact Area

The at-grade light rail guideway would encroach along the eastern edge of park, displacing the landscaping strip, large trees, and some existing parking. As part of the project, properties located to the west of 112th Ave SE between Main Street and Surrey Downs Park would be acquired. Once the project is built and in operations, a substantial amount of the acquired area will be available and could be developed into an open space linear park. This new linear park would replace the impacted area in Surrey Downs Park, which is primarily passive open space. The project would not result in noise impacts to the park because, based on FTA criteria, the actual uses of this park are not noise sensitive. Refer to Section 4.7, Noise and Vibration, for complete information.
The vehicle access point at the north end of the park would be closed, consistent with the proposed master plan. The existing vehicle access at the southern end and the pedestrian connection to the neighborhood at the southeast corner at 111th Avenue SE would not be affected. Design improvements to the south driveway would minimize impacts associated with the removal of the north driveway. Vehicle access to the park would also be right-in and right-out along 112th Avenue SE. U-turn movements would be provided at nearby intersections to minimize out of the way travel for vehicles that access the park north along 112th Avenue SE. No active recreation facilities would be affected.

Removing vegetation and trees would result in a visual change, but the vegetation would be replaced and eventually mature. The light rail guideway would be consistent with the existing transportation nature of the 112th Avenue SE corridor. *Preferred Alternative C11A* would also temporarily acquire 0.6 acre for a temporary construction easement. Construction impacts such as noise, dust, visual change, and reduced parking would be noticed by park users but would not inhibit normal use of the park. There are no active park use areas along 112th Avenue SE. Vehicle and pedestrian access to the park from 112th Avenue SE would be maintained during construction. The activities, features, and attributes of the park would not be substantially diminished.

Preferred Alternative C11A would affect some elements of the current *Surrey Downs Park Master Plan* adopted by the Bellevue City Council in March 2009. The light rail guideway would encroach into the planned garden terraces and path bordering 112th Avenue SE. *Preferred Alternative C11A* would relocate or eliminate the proposed pedestrian access points from 112th Avenue SE at the park's northeast corner.

The project would minimize impacts during operation and construction by using the area of the park not currently used for active recreation along 112th Avenue SE, limiting permanent light rail use to approximately 4 percent of the park. Sound Transit would coordinate with the City of Bellevue to revise the *Surrey Downs Park Master Plan* before the park is developed to address the light rail and integrate the two facilities, as appropriate.

Preferred 110th NE Tunnel Alternative (C9T)

As illustrated on Exhibit D-12, *Preferred Alternative C9T* would permanently acquire approximately 0.5 acre of Surrey Downs Park (approximately 4 percent of the park) along its northeast boundary along 112th Avenue SE for the at-grade light rail guideway, and realign SE 4th Street to create a four-way intersection with SE 6th Street and 112th Avenue SE (see Table D-3). Similar to *Preferred Alternative C11A*, the north vehicle entrance to the park would be closed. This area of the park is characterized by a steep slope and trees along 112th Avenue SE, a vehicle entrance, and parking lots accessing the park facilities and the King County Courthouse building. As part of the project, properties located to the west of 112th Ave SE between Main Street and Surrey Downs Park would be acquired. Once the project is built and in operations, a substantial amount of the acquired area will be available and could be developed into an open space linear park. This new linear park would replace the impacted area in Surrey Downs Park, which is primarily passive open space.

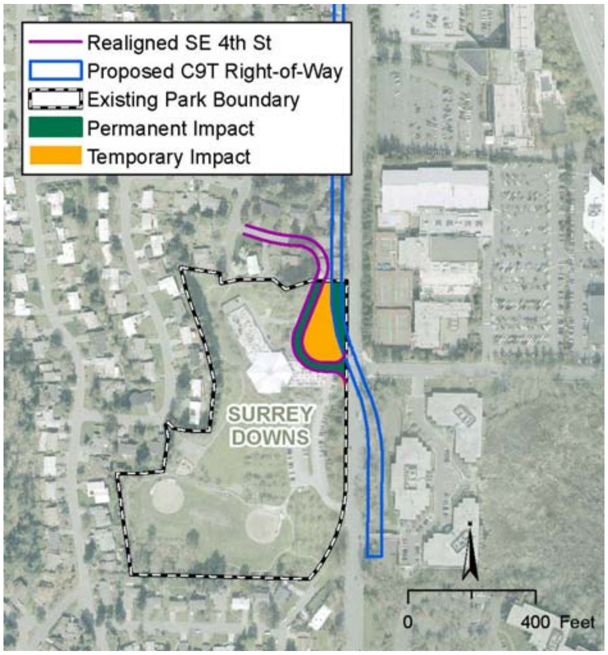

EXHIBIT D-12
Preferred 110th NE Tunnel Alternative (C9T)
Surrey Downs Park Impact Area

There would be no noise impacts, similar to *Preferred Alternative C11A*. Park impacts at the northeastern portions of the resource would be similar to those from *Preferred Alternative C11A*, but there would be no impacts on the park south of SE 6th Street where *Preferred Alternative C9T* would remain on the east side of 112th Avenue SE. *Preferred Alternative C9T* would realign SE 4th Street to replace the neighborhood access with a four-way intersection with SE 6th Street and 112th Avenue SE. The roadway would result in permanent use of park property for the roadway separating a half-acre area from the remainder of the park. The curved design of the realigned roadway would maintain slow vehicle movements through the park and would not access the parking areas for the park. A second option would provide a new connection into the Surrey Downs neighborhood at SE 9th Street from the south park entrance. Access to the neighborhood from the south park entrance would permanently close the north entrance reducing park impacts, but it would result in changing circulation patterns in the neighborhood. No active recreation facilities would be affected under either option.

This alternative would temporarily acquire 0.5 acre for a temporary construction easement. Construction impacts such as noise, dust, and visual change would be noticed by park users but would not inhibit normal park use because there are no active park use areas along 112th Avenue SE. Vehicle and pedestrian access to the park from 112th Avenue SE would be maintained during construction. The activities, features, and attributes of the park would not be substantially diminished.

Preferred Alternative C9T would affect elements of the *Surrey Downs Park Master Plan* and would result in impacts similar to *Preferred Alternative C11A* at the northeastern side of the park, including encroachment of light rail into the planned garden terraces and path bordering 112th Avenue SE. In addition, realigning SE 4th Street would further encroach into a portion of the area planned for the community facility. *Preferred Alternative C9T* would relocate or eliminate one of the two proposed pedestrian access points, with the access point at SE 6th Street combined with the realigned SE 4th Street access to the park.

Minimization measures are similar to those discussed for *Preferred Alternative C11A*, with the addition of landscaping along the realigned SE 4th Street adjacent to the park. Sound Transit will coordinate with the City of Bellevue to initiate revision of the *Surrey Downs Park Master Plan* before park development to address the light rail guideway, roadway, and needed parking and integrate the two facilities, as appropriate.

Other Segment C Alternatives

The other Segment C alternatives would also not result in noise impacts from light rail operations at Surrey Downs Park. A narrow strip of permanent acquisition would occur along the eastern edge of Surrey Downs Park when the Alternative C2T, C3T, C4A, and C7E connect to Alternative B2A, but this area would not conflict with the Surrey Downs Park Master Plan. These alternatives would require widening the right of way along 112th Avenue SE for the light rail project. The area needed for each alternative is shown in Table D-3 and depicted in Exhibit D-13.

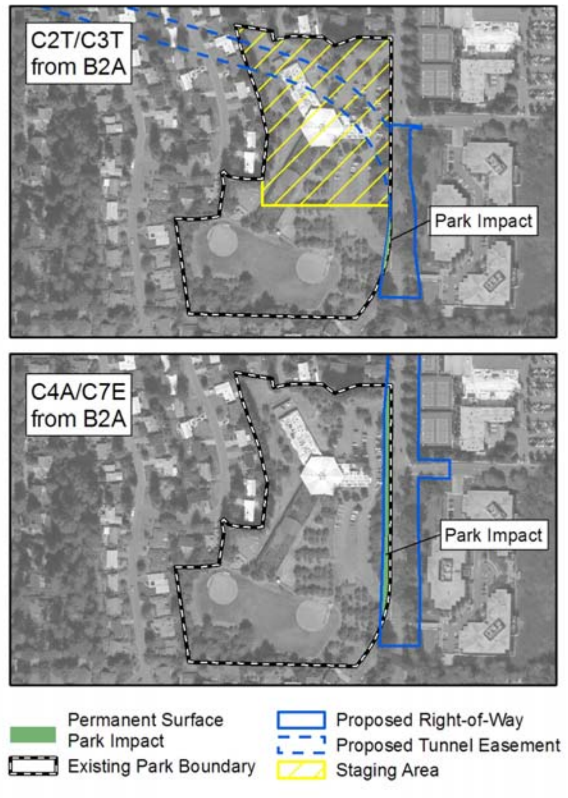

EXHIBIT D-13
Surrey Down Park Proposed Right-of-Way and Staging Areas in Segment C

The affected area constitutes about 0.5 to 4.4 percent of the 11.4-acre park, depending on the alternative. The direct use would reduce the landscaped strip of land that separates the existing parking area from the sidewalk along 112th Avenue SE. This use does not affect active recreational areas of the park and therefore would not result in adverse impacts on the activities, features, and attributes of the facility.

Constructing Alternative C2T or C3T that connect with the Alternative B2A would require closing the northern half of the park (the District Court House portion of the park), about 5.7 acres, for approximately 4 to 5 years to stage and construct the tunnel. This would be unique for Alternative C2T or C3T when connecting from Alternative B2A. This area of the park is not currently used as a park or recreational facility. The southern half of the park, containing ball fields and existing active park uses, would remain open and functional during construction. Parking and pedestrian access would be maintained during construction. A net benefit to the overall park facility from only Alternative C2T and C3T is expected to occur as a result of the removal of the District Court House by the East Link Project, if it is not already relocated before project construction begins. The removal might facilitate implementation of the Surrey Downs Park Master Plan. However, depending on park development schedule, the construction staging at this location might delay implementation of this park plan. Following construction, the tunnel would be underground and not visible within the park.

Although the southern half of the park would remain open during construction of Alternatives C2T and C3T, park users would experience impacts from adjacent construction. These impacts would include noise, dust, and some access restrictions because vehicle access would be limited to only one of the two current entrances. Pedestrian access to adjoining neighborhoods would be maintained at two of the three current locations. Parking would be limited because approximately half of the parking is located at the north end of the site, although much of that parking serves the District Court House.

NE 2nd Pocket Parks

Preferred 110th NE Tunnel Alternative (C9T)

Preferred Alternative C9T would impact the NE 2nd Place Pocket Park during project operation and construction (as shown in Table D-4 and Exhibit D-14). The park comprises green space at the four quadrants of the intersection of 110th Avenue NE and NE 2nd Place, which serve as visual green space but do not include any facilities. The City of Bellevue, however, would like to develop these areas as a neighborhood park (City of Bellevue, 2010).

TABLE D-4
Segment C Alternatives Impact Area in NE 2nd Pocket Park

Alternative	Permanent (acres)	Temporary (acres)
Preferred Alternative C11A	None	None
Preferred Alternative C9T	0.1	0.3
Alternative C1T	None	None
Alternative C2T	None	None
Alternative C3T	None	None
Alternative C4A	0.1	0.3
Alternative C7E	None	None
Alternative C8E	0.1	0.1
Alternative C9A	Less than 0.1	0.1
Alternative C14E	None	None

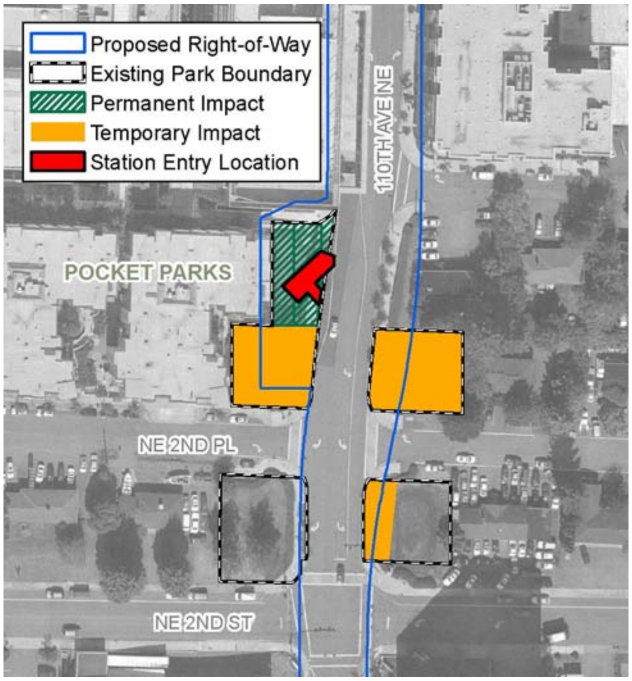

EXHIBIT D-14
Preferred 110th NE Tunnel Alternative (C9T) Pocket Park Impact Area

A portion of the northwest quadrant of the park, approximately 0.1 acre, would be incorporated into a station entrance and developed as an outdoor public plaza. A tunnel easement would be acquired under the northeast and southeast quadrants of the park, and the area above the tunnel would be returned to park use after construction. Although *Preferred Alternative C9T* would be in a tunnel the station entrance would be visible, but would not result in any permanent visual impacts.

Construction activities associated with the cut-and-cover tunnel for *Preferred Alternative C9T* would require the use of both park quadrants on the east side of 110th Avenue NE and the northwest quadrant, for a total construction easement of approximately 0.3 acre. The northwest and northeast quadrant would be closed during construction with the northeast quadrant being used as part of a larger staging area. Park users would experience noise, dust and visual change. After construction, the NE 2nd Place Pocket Park would be more accessible to the public through the station plaza.

Other Segment C Alternatives

The Couplet Alternative (C4A) would intrude into the southwest quadrant of the Pocket Park roughly 10 to 15 feet to accommodate the additional right-of-way required for the northbound light rail trackway (Exhibit D-15). This would acquire and use directly 0.1 acre or less than 10 percent of the total park area. Because this park contains no facilities and serves principally as open space, this park could continue to operate as it does currently.

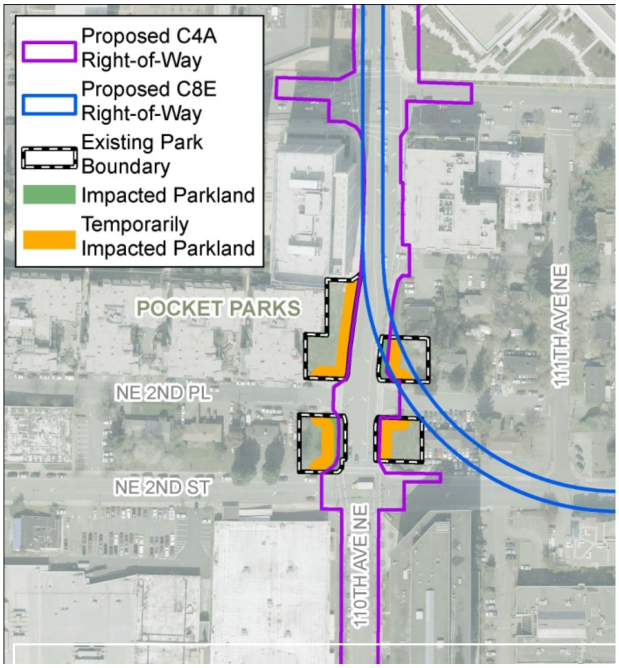

EXHIBIT D-15
Alternatives C4A and C8E Pocket Park Impact Area

Given its current use and proximity to roadway traffic and bus routes that use 110th Avenue NE, no noise or visual impacts are expected to occur. During construction, portions of all four quadrants would be affected, but remaining areas would still be available for use (Exhibit D-15). In addition, the 110th NE Elevated Alternative (C8E) would pass over 0.1 acre of the northeast quadrant of the Pocket Park (approximately 2,100 square feet), requiring a permanent easement and resulting in shading of the park and a visual intrusion (Exhibit D-15). The northeast quadrant of the park would be closed during construction because the area would be used for staging. However, because this park contains no recreational facilities and serves principally as open space, it is expected that this park could continue to operate as it does currently. Alternative C9A would permanently acquire less than 0.1 acre of the western edge of the Pocket Park quadrants on the east side of 110th Avenue NE (Exhibit D-16). During construction of Alternatives C4A, C8E, or C9A, park users might experience increased noise, dust, and temporary access restrictions in the pocket parks.

McCormick Park

Preferred 108th NE At-Grade (C11A)* and *Preferred 110th NE Tunnel (C9T) Alternatives

Preferred Alternative C11A and *Preferred Tunnel Alternative C9T* would not impact McCormick Park.

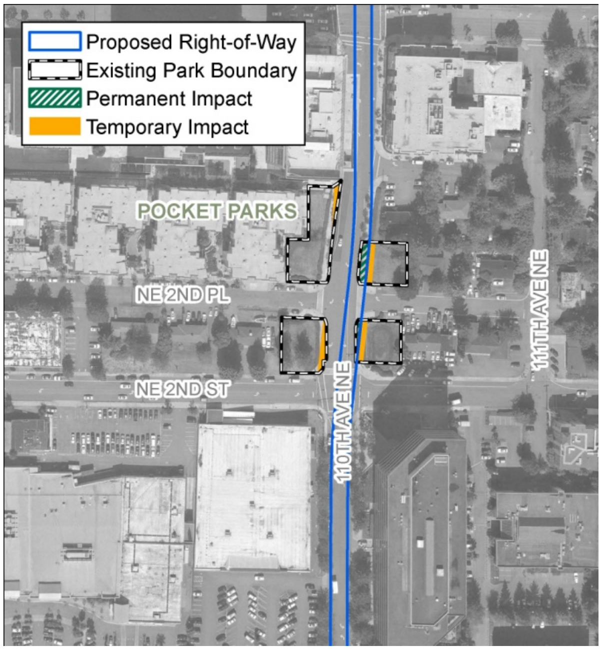

EXHIBIT D-16

[a] Includes park and nonpark areas.

Other Segment C Alternatives

Alternatives C3T, C4A, and C8E would acquire and directly use McCormick Park as shown in Exhibit D-17 and Table D-5. No noise impacts would occur from any alternative as the park is not noise sensitive.

Under the 108th NE Tunnel Alternative (C3T), the eastern portion of McCormick Park would include the portal and light rail structure along NE 12th Street. A retained fill or transition structure (gradual in height and approximately 550 feet long) would support the light rail track as it transitions from a tunnel to aboveground profile, impacting 0.6 acre of the park. This would result in a much different user experience than exists today as a result of additional structures in the park. Much of the construction would occupy and remove the existing mature evergreen trees along the north edge of the park. Once complete, the area used for construction staging as well as the area above the underground tunnel from roughly 108th Avenue NE to 110th Avenue NE would be used to recreate the parkland, resulting in an overall increase of the park size by about 1 acre.

With the Couplet Alternative (C4A), impacts would be similar to those described under Alternative C3T, although Alternative C4A would have a longer section of trackway in the park and a structure transitioning into an elevated profile over 112th Avenue NE. Approximately 0.5 acre of park would be impacted at the surface, and 0.3 acre would be under the elevated guideway.

Also similar to Alternative C3T, construction would occupy the park and remove the mature trees. The area used for construction staging would be used to recreate the parkland when construction is finished. The ultimate configuration of the park would increase in size by approximately 0.2 acre.

With the 110th NE Elevated Alternative (C8E), the elevated profile would cross NE 12th Street over the park and pass over 0.2 acre of the northern edge of the park between 111th Avenue NE and 112th Avenue NE. Because the light rail structure would be elevated approximately 30 feet above the park in this area, the structure would become a dominant and noticeable feature, which would affect the visual environment for some park users. However, no access would be impeded to and from other portions of the park. Only a portion of the park and some of the mature trees would be affected by construction. Like Alternatives C3T and C4A, once construction is complete, the area used for construction staging would be used to recreate the parkland and the park would slightly increase in size. Alternative C8E would result in the least impact of the three alternatives affecting McCormick Park.

Under each of these alternatives, the new park vegetation would take several years to mature, and, until the vegetation is reestablished, a temporary change in visual quality for park users would occur as well as a reduction in the ability of the park to function as a buffer from adjacent uses. The primary

East Link Project

purpose of McCormick Park to serve as a buffer between the residences of the Northtowne Neighborhood to the north and high-density residential and commercial areas to the south would ultimately be restored. Constructing the alternatives would close McCormick Park from 108th to 112th Avenue NE with Alternatives C3T and C4A and from approximately 110th to 112th Avenue NE with Alternative C8E for approximately 4 to 5 years.

Potential Surrey Downs Historic District

There is no direct use of the potential Surrey Downs Historic District under any of the East Link Alternatives. However, in coordination with the State Historic Preservation Office, a concern for the possibility of proximity impacts on the potential historic district of the construction and staging areas, therefore the constructive use test is applied as described in Section D.3.3 and per 23 CFR 771.135.

A series of homes in Surrey Downs has the potential to be eligible for the NRHP as a historic district because they are part of a distinctive residential subdivision developed during the period 1952-1956; many of the houses represent a Pacific Northwest regional variant of the Modern architectural design style of post-World War II residential architecture; a number of the houses are based on the designs of a prominent Seattle architectural firm Mithun & Nesland (now Mithun Partners); and the neighborhood retains a high degree of design unity and cohesiveness. Although the owners have altered many of these houses—some substantially—since then, the neighborhood retains an unusual degree of design quality and cohesiveness.

While the potential district has not been fully delineated, there are 18 houses inventoried within the study area including one-story houses with carports and two-story houses with garages located beneath the living space. Properties that contribute to the potential historic district feature open plans, large areas of glass, and extensive use of wood. Hardwood floor and exposed beams characterize the house interiors, while the exteriors show wood siding, exposed rafters, and wooden roof supports. Skylights supplement the windows, which are plentiful and large, maximizing the amount of light admitted. All of these factors contribute to the unity of design and quality that distinguishes this portion of the subdivision.

Preferred 108th NE At-Grade Alternative (C11A)

When connecting from *B2M*, *C11A* would only remove noncontributing properties along 112th Avenue SE, Main Street, and one property along 111th Avenue SE (Exhibit D-18). Connections from B3 or B7 would not require the removal of homes along 112th Avenue SE.

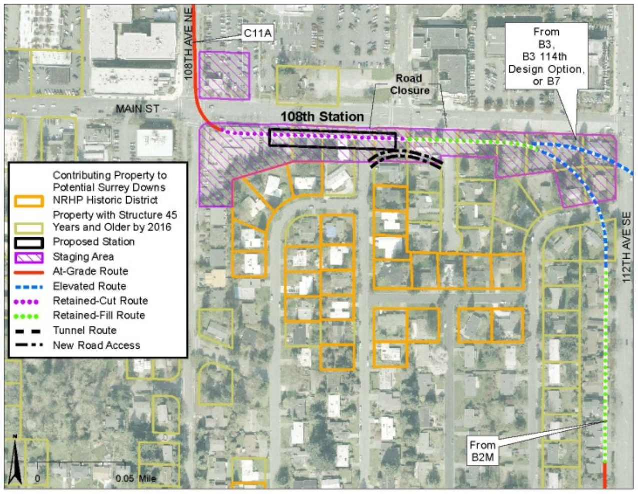

EXHIBIT D-18
Proximity of *Preferred Alternative C11A* to Potential Surrey Downs Historic District

At least one row of noncontributing properties would remain between the contributing properties and the project along 112th Avenue SE and most of Main Street. The project would be adjacent to three contributing homes at Main Street and 108th Avenue.

The potential historic district's setting would not be directly affected by the removal of noncontributing properties and the 108th Station and trackway along Main Street. Due to the orientation away from Main Street, the impact would not alter the sense of the potential historic district neighborhood.

Operating *Preferred Alternative C11A* could have potential moderate noise impacts on three contributing properties in the northwest portion of the potential district, located south of the proposed station; however, these noise impacts would be minimized and avoided with a sound barrier in the form of a berm or wall, included along the 112th Avenue SE and Main Street portions of the project. During final design, Sound Transit would assess whether or not the existing large coniferous trees located next to the contributing properties near the 108th Station could be preserved, which is Sound Transit's intention. Project components such as station design, landscaping, and a sound barrier would minimize project visual and noise effects, create a buffer from the project, and enhance the neighborhood boundary where noncontributing properties would be removed. Additionally, there would be no vibration after mitigation. Therefore there would not be substantial vibration or noise interference with the residential use of the properties under operation nor would any of the aesthetic features or attributes of the neighborhood be impaired.

Preferred Alternative C11A would close SE 4th Street access to 112th Avenue SE. However, SE 1st Place would remain open, maintaining access to 112th Avenue SE for the neighborhood north of Surrey Downs Park. Direct physical intrusion from the adjacent urban traffic would be substantially minimized under *C11A* because it would also close 110th Avenue SE and 110th Place access to Main Street; alternate access points to the neighborhood from Main Street via 108th Avenue SE would continue to provide access. Therefore the utility of the potential historic district is maintained for its residents.

Operation of *Preferred Alternative C11A* would not substantially diminish the attributes, features or qualities that are protected under Section 4(f) and therefore no constructive use would result from operation of *C11A*.

The construction effects of *Preferred Alternative C11A* would be temporary, and would not impact historic structures or substantially diminish the residential use during construction. The *C11A* construction impacts would be temporary, lasting about five years overall, with the most intense construction activities (demolition, clearing, and heavy construction) occurring during the first couple years. Construction activities could result in noise, visual, and dust impacts on nearby residences. Construction truck traffic would use the Main Street and 112th Avenue SE arterials without passing through the potential historic district. Typical construction for guideways and stations would occur on a 5- to 6-day work week schedule and would occur primarily between the hours of 7 a.m. and 10 p.m. In some locations (such as when street detours are involved and/or daytime construction periods need to be abbreviated to reduce impacts), additional shifts, all-week, or nighttime construction activities could be necessary.

Sound Transit would, as practical, limit construction activities that produce the highest noise levels to daytime hours, or when disturbance to sensitive receivers would be minimized. Contractors would be required to meet the criteria of the noise ordinance for the city and would seek the appropriate noise variance for operation of construction equipment that could exceed allowable noise limits during nighttime hours (between 10:00 p.m. and 7:00 a.m.), on Sundays or legal holidays. Sound Transit would control nighttime construction noise levels by applying noise level limits and noise control measures to meet these noise limits.

To minimize and avoid effects of construction on the potential Surrey Downs Historic District, construction of *Preferred 108th NE At-grade Alternative (C11A)* would include installation of a solid construction barrier to shield adjacent eligible houses from construction and preservation of the evergreen trees along the south edge of the station area, east of 108th Avenue SE. The residences would not experience noise that would substantially interfere with the residential uses.

During construction, the properties that would be removed for the project right-of-way along Main Street would also be used for staging areas. Staging is a relatively low intensity activity compared with construction. Construction staging areas are needed before, during, and for a short time after construction work occurs to store construction equipment, store construction materials, and to give contractors a temporary location to meet and work near the construction site. Staging areas may include contractor trailers (which would act as temporary offices and places for contractors to meet) and construction crew parking. In some circumstances, staging can provide additional buffer for adjacent properties during construction. The period of construction would be not lower the livability of the existing neighborhood.

The construction phase of *Preferred Alternative C11A* would not result in noise, visual, or access limitations that would substantially diminishing the attributes, features or qualities that are protected under Section 4(f) and therefore no constructive use would result on the potential Surrey Downs Historic District.

Preferred 110th NE Tunnel Alternative (C9T)

Preferred 110th NE Tunnel Alternative (C9T) would not be adjacent to any contributing properties of the potential historic district. It would remove one row of noncontributing properties along 112th Avenue SE and one to two rows of noncontributing properties at the northeast corner of the neighborhood where 112th Avenue SE meets Main Street when connecting to *Preferred Alternative B2M* (Exhibit D-19). Fewer noncontributing properties would be removed along Main Street as compared with *C11A* because *C9T* enters a tunnel on the south side of Main Street and turns north to tunnel under 110th Avenue NE.

The *Preferred Alternative C9T* would not affect any contributing properties in the potential NRHP-eligible Surrey Downs historic district during construction. This alternative would be far enough away from contributing properties to avoid an adverse impact during construction. *Preferred Alternative C9T* would not result in noise, vibration, or visual impacts or access limitations that would substantially diminishing the attributes, features or qualities that are protected under Section 4(f) and therefore no constructive use would result on the potential Surrey Downs Historic District.

EXHIBIT D-20
Staging Area for Connections from Alternative B2E vs. Alternatives B3 and B7 for Alternatives C2T and C3T

Other Segment C Alternatives

Alternative C9A would be similar to *Preferred Alternative C9T* in that it would be far enough away from the potential Surrey Downs Historic District that it would not result in noise, vibration, or visual impacts, or access limitations that would substantially diminishing the attributes, features or qualities that are protected under Section 4(f). Therefore Alternative C9A would not result in a constructive use of the potential Surrey Downs Historic District. Likewise, Alternatives C2T and C3T with connections from Alternative B3 or B7, respectively, would not result in constructive use of the potential Surrey Downs Historic District because the construction areas are similar to *Preferred Alternative C9T* and Alternative C9A.

The connector from Alternative B2A to C2T and C3T would involve boring a tunnel beneath the potential Surrey Downs Historic District, which would avoid access and visual impacts. Noise and possible vibration could be noticeable to residents during construction but would not affect the contributing buildings. Although the geotechnical analysis shows that the soils in this area are generally resistant to settlement from ground disturbance, precautions during construction and a careful monitoring program would be incorporated into the construction plan.

The connector from Alternative B2E to C2T and C3T would use the northern area of the Surrey Downs subdivision for construction staging at the tunnel portal whereas if C3T connects from B3 or B7, the staging area would displace fewer homes and be further away from contributing residences (Exhibit D-20). The staging area activities for C3T from B3E would be the same as described for C11A and C9T, consisting of storing materials and parking. Construction would alter access at times during construction and would produce visual, noise, dust, and possible vibration impacts. Upon implementing the avoidance and minimization measures during construction, the impacts would be temporary and would not affect historic structures nor the livability of the neighborhood. The temporary or operational phases of these alternatives would not result in noise, esthetic, vibration impacts or access limitations that would substantially diminishing the attributes, features or qualities that are protected under Section 4(f) and therefore no constructive use would result on the potential Surrey Downs Historic District.

For connectors from Alternatives B2A and B2E to Alternative C4A (Exhibit D-21), construction staging areas would affect similar properties as *Preferred Alternative C11A*. Construction would alter access at times during construction and would produce visual, noise, dust, and possible vibration impacts. For connectors from Alternative B3 and B7 to Alternative C4A, construction staging would involve a smaller area but would still be adjacent to portions of the potential Surrey Downs Historic District. Constructing the connectors to Alternative C4A would be shorter in duration and require less nighttime construction than construction for tunnel alternative, such as Alternatives C2T and C3T and *Preferred Alternative C9T*.

There would be no effect on the potential Surrey Downs Historic District for connectors from Alternatives B3 and B7 to Alternative C7E, C8E, or C14E. Each alternative is located far enough away from the Surrey Downs subdivision to have no

impacts on the resources within it. For all alternatives that do border the potential Surrey Downs Historic District, Sound Transit would apply minimization and avoidance measures as previously described under *Preferred Alternative C11A*. After construction, the area would be landscaped offering a physical buffer separating the neighborhood and the downtown urban area. As with the preferred alternatives, none of the alternatives would result in substantially diminishing the attributes, features or qualities that are protected under Section 4(f) during operation or construction and no constructive use.

D.4.2.4 Segment D

Alternative D3 would use a narrow strip of the parcel on which the former Bellevue Fire Station sits (Exhibit D-22). The alternative would not result in visual, noise, vibration, or other impacts on the property. Widening of the road and introduction of the retained-cut light rail would not impact the setting, which is characterized by major roadways: Bel-Red Road, 148th Avenue NE, and NE 20th Street. Although the building's parcel is situated inside the Area of Potential Effect (APE), the building itself is outside the APE and not affected by the roadway widening during operation or construction.

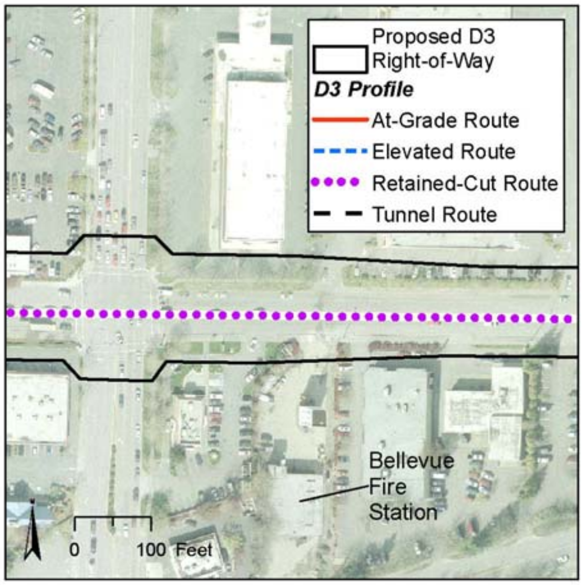
D.4.2.5 Segment E

There are six parks, open spaces, and recreation areas potentially impacted by Segment E alternatives (Table D-6).

Marymoor Park

Preferred Marymoor Alternative (E2)

Preferred Alternative E2 would encroach about 30 feet into the northern boundary of the 640-acre Marymoor Park, acquiring and using approximately 2.0 acre of the total park area (Exhibit D-23).



Proposed D3 Right-of-Way
D3 Profile
At-Grade Route
Elevated Route
Retained-Cut Route
Tunnel Route
Bellevue Fire Station
0
100 Feet

EXHIBIT D-22
Alternative D3 Former Bellevue Fire Station Impact Area

The Marymoor Park contains soccer fields, baseball fields, a velodrome, tennis courts, a recreational event center and a climbing rock nearby SR 520 and the *Preferred Alternative E2* alignment. No recreation facilities would be directly impacted by light rail operations; however, equestrians ride along the park's northern property boundary—an unofficial equestrian route.

The equestrian route might be relocated if there is not enough distance between the guideway and sports fields to accommodate the users. Given the existing proximity to SR 520, users would not likely experience additional proximity impacts. The project would not result in noise impacts based on FTA criteria, because the actual uses of this park are not noise sensitive. Sound Transit would evaluate potential noise impacts in accordance with FTA noise method and criteria when Segment E is funded and design advances.

Construction would acquire a temporary easement of 3.0 acres along the northern park boundary to accommodate an access road and construction staging. This area consists of an approximately 15- to 50–foot width of property for the length of the park along SR 520. The temporary construction area would be sited to avoid impacts on those recreational activities closest to the alignment, specifically the soccer fields, event area and the velodrome and, thus, would not affect these recreational functions. However, this area is used as an unofficial equestrian route, which would have to be temporarily rerouted if there is not enough distance between the construction area and the soccer and ball fields to accommodate these users.

TABLE D-6
Permanent Impacts on Parks and Open Spaces in Segment E

	Park Name						
Impact Area: (acres)	**Town Center Open Space**	**Luke McRedmond Landing**	**Marymoor Park**	**Sammamish River Trail**	**East Lake Sammamish Trail**	**Bear Creek Trail**	**The Edge Skate Park**
Preferred Marymoor Alternative (E2)	None	None	2.0 acres	0 acre [a]	Shade, possible relocation of trail section	0.1 acre	None
E2 - Redmond Transit Center Design Option	None	None	2.0 acres	0 acre [a]	Shade, possible relocation of trail section	0.1 acre	Less than 0.1 acre
Redmond Way Alternative (E1)	None	0.1 acre	None	0.1 acre	Shade, relocation of trail section with MF 5 only	0.1 acre	None
Leary Way Alternative (E4)	0.7 acre	None	None	0.1 acre	Shade, relocation of trail section with MF 5 only	0.1 acre	None

[a] Impacts to this trail for Preferred Alternative E2, and E2-Transit Center Design Option are counted under Marymoor Park.

The project would not impair protected activities, features, or attributes of the park. E2 - Redmond Transit Center Design Option would have the same impacts as *Preferred Alternative E2*.

Luke McRedmond Landing

Preferred Marymoor Alternative (E2)

Preferred Alternative E2 and the E2 - Redmond Transit Center Design Option would not impact Luke McRedmond Landing.

Other Segment E Alternatives

The elevated portion of Alternative E1 would intrude into the park's northwest boundary, thereby acquiring and directly using 0.1 acre, or roughly 5 percent of the total park area, which would be under the elevated structure. This would remove mature trees lining Redmond Way, but no park facilities would be impacted. Because the light rail structure would be elevated approximately 30 feet above the park adjacent to Redmond Way, the structure would become a dominant and noticeable feature, which would affect the visual experience of park users. Trees would be replaced per the City of Redmond tree ordinance. During construction, park users would experience impacts from adjacent construction, including noise, dust, and potential access restrictions as materials are hauled to and from the site, and some parking spaces would be temporarily removed. However, there would be no impacts on the recreational functions of the park and no noise impacts because the actual uses of the park are not noise sensitive based on FTA criteria.

Sammamish River Trail

Preferred Marymoor Alternative (E2)

The *Preferred Alternative E2* would span the Sammamish River Trail south of SR 520, where it is part of Marymoor Park. This would result in an additional 20 feet (approximately) of trail shading. This impact would not result in a permanent physical impact on the continued use of the trail, which already passes underneath three other overpasses in this area, one of which, SR 520, would be located 80 feet away. A column could be placed near the trail; however, the columns would more likely be placed in WSDOT right-of-way. Construction would require temporary trail detours to maintain trail usage. During construction, park users would experience impacts from adjacent construction, including noise and dust, however since the trail section is perpendicular to this crossing, the construction would not inhibit trail use and the construction would be a short duration of less than the construction for the project alternative.

A detour would be provided to allow for the continuity of the trail, and the trail would be fully restored following construction. E2 - Redmond Transit Center Design Option would have the same impacts as *Preferred Alternative E2*.

Other Segment E Alternatives

All Segment E Alternatives would be similar impacts as the *Preferred Alternative E2*. No direct use of the trail would occur under any of the alternatives. Alternative E1 would span two segments of the trail that run north-south on either side of the Sammamish River south of Redmond Way SE. This would result in additional shading of the trail for roughly 10 to 20 feet. However, it is not anticipated that this impact would impair the continued use of the trail, which already passes underneath three other overpasses in this area, including the SE Redmond Way overpass 30 feet away.

Segment E
East Link Project

It is also likely that one or more columns would be placed in or in the vicinity of the trail (on either the west or east side of the river), given the turning radius and distance of the crossing of Alternative E1. This configuration might require the realignment of the trail such that no columns impede use of the trail.

Similar to Alternative E1, Alternative E4 would span two segments of the trail that run north-south on either side of the Sammamish River south of Leary Way. This would result in an additional 10 to 20 feet (approximately) of trail shading; however, it is not anticipated that this impact would impair the continued use of the trail, which already passes underneath three other overpasses in this area, including the Leary Way overpass directly adjacent to the proposed guideway. It is also likely that one or more columns would be placed in the vicinity of the trail (on either the west or east side of the river).

During construction, the trail under each of the alternatives would be detoured for public safety reasons and to allow for the continuity of the trail. During construction, park users would experience impacts from adjacent construction, including noise, dust. The trail would be fully restored following construction with no permanent adverse physical impacts on the trail. The occupancy would be shorter than the period of construction.

Bear Creek Trail

Preferred Marymoor Alternative (E2)

In order for the light rail guideway to cross over Bear Creek Trail, the trail would be lowered by 20 feet in a retained cut in its existing location. This would place the trail in a short tunnel for approximately 30 feet, but this impact would not impair the continued use of the trail. Lowering the trail would maintain the gradient, width, and height clearance to accommodate all trail users. A column could be placed near the trail, but it would not impair trail use. Construction would require temporary trail detours to maintain trail usage and to allow for trail continuity. During construction, park users would experience impacts from adjacent construction, including noise, dust. The trail would be fully restored following construction with no permanent adverse physical impacts on the trail. The occupancy would be shorter than the construction period and not change property ownership. E2 - Redmond Transit Center Design Option would have the same impacts as *Preferred Alternative E2*.

Other Segment E Alternatives

Alternatives E1 and E4 would cross the Bear Creek Trail and would result in approximately 20 feet of shading on the trail; however, it is not anticipated that this impact would impair the continued use of the trail. Because the light rail structure would be elevated approximately 20 to 35 feet above the trail in this area, depending on which alternative is constructed, the structure would become a dominant and noticeable feature that could affect the visual environment for some trail users.

During construction, the trail under each of the alternatives would be detoured for public safety reasons and to allow for the continuity of the trail. The trail would be fully restored following construction. Impacts would be the same as *Preferred Alternative E2,* but for different length of the trail. During construction, park users would experience impacts from adjacent construction, including noise, dust. Construction would require temporary trail detours to maintain trail usage and allow for the continuity of the trail. The occupancy would be shorter than the period of construction, not involve a change in ownership of the property. The work would be minor with full replacement of the trail and the environment following construction with no permanent adverse physical impacts on the trail. The trail would be fully restored following construction.

East Lake Sammamish Trail

Preferred Marymoor Alternative (E2)

Preferred Alternative E2 would potentially realign and relocate a portion of the East Lake Sammamish Trail within its existing corridor. Design of *Preferred Alternative E2* along the former BNSF Railway corridor assumes a future trail to be developed by others. The former BNSF Railway corridor is adequately wide enough to accommodate both facilities. Also, one or more columns could be placed near the trail. Project operation would not impact access to the trail and its connection to the Bear Creek Trail.

The corridor has an urban and transportation character; it is in a former railroad corridor and contains an existing SR 520 overpass. Therefore, the visual change of the East Link Project would not substantially impair views from the trail. During construction, park users would experience impacts from adjacent construction, including noise, dust. Construction would require temporary trail detours to maintain trail usage and allow for the continuity of the trail. The occupancy would be shorter than the period of construction, not involve a change in ownership of the property. The work would be minor with full replacement of the trail and the environment following construction with no permanent adverse physical impacts on the trail. The trail would be fully restored following construction. E2 - Redmond Transit Center Design Option would have the same impacts as *Preferred Alternative E2*.

Other Segment E Alternatives

Under Alternatives E1 and E4, the East Lake Sammamish Trail would likely be relocated and reconstructed in the area along the former BNSF Railway corridor for approximately 2,200 feet where the SE Redmond Station would be located. Design of Segment E alternatives along the former BNSF Railway corridor assumes a future trail to be developed by others. Impacts would be the same as *Preferred Alternative E2,* but for different length of the trail. During construction, park users would experience impacts from adjacent construction, including noise, dust. Construction would require temporary trail detours to maintain trail usage and allow for the continuity of the trail. The occupancy would be shorter than the period of construction, not involve a change in ownership of the property. The work would be minor with full replacement of the trail and the environment following construction with no permanent adverse physical impacts on the trail. The trail would be fully restored following construction.

Redmond Central Connector Trail

The City of Redmond has plans to develop the recently acquired Redmond section of the former BNSF Railway for a trail and linear park as well as accommodating local and regional utility needs. Together, these uses have the potential to reduce the amount of space available for light rail. Since a stormwater utility project and the first phase of the trail are scheduled to be constructed in 2011 and 2012, the City of Redmond would work with Sound Transit to accommodate the light rail project which may require a shift in its current conceptual alignment or possible rerouting of the trail, replacement of a affected trail amenities, and restoration of vegetation. This would affect all of the Segment E alternatives in the former BNSF railway.

The Edge Skate Park

Only E2 - Redmond Transit Center Design Option would impact a portion of the Edge Skate Park, located along 161st Avenue NE at NE 83rd Street. The design option would require a small portion, less than 0.1 acre of the western portion of the park, which contains the sidewalk and narrow lawn area, but would not affect any recreational facilities of the skate park.

Construction would require a temporary easement of 0.2 acres and construction activities could have proximity effects to Edge Skate Park users, because construction would occur directly adjacent to this facility. Construction along the side of the park would be shorter than the duration of construction and the minor area would be restored upon completing construction. However, construction noise and dust are not anticipated to impact the recreational functions of the skate park since these functions do not rely on quiet atmosphere. The occupancy would be shorter than the period of construction, not involve a change in ownership of the property. The work would be minor with full replacement of the landscaping area and the environment following construction with no permanent adverse physical impacts on the park.

Justice William White House

Preferred Marymoor Alternative (E2)

Preferred Alternative E2 and the E2 - Redmond Transit Center Design Option would not have an impact on the Justice White House and would not incorporate property from the resource. Therefore, there would be no Section 4(f) use.

Other Segment E Alternatives

Alternative E1 would not have an impact on the Justice William White House and would not incorporate property from the resource. Therefore, these alternatives would have no use of this Section 4(f) resource.

Alternative E4 would require the relocation of the Justice William White House, which would cause an impact on the historic context and potentially damage the building. Sound Transit has consulted with the City of Redmond and DAHP about moving the building to a nearby location, which would preserve its setting, feeling, and association with the former BNSF Railway to the extent possible. Sound Transit would consult further with the City and DAHP to find appropriate sites for the house and repair any damage to the building or demolish the building if no sites are found.

D.5 Measures to Mitigate Harm on Section 4(f) Resources

D.5.1 Measures to Mitigate Harm on Park and Recreational Resources and *de minimis* Findings

The East Link Project has undergone a 5-year environmental review process, including extensive outreach efforts and numerous studies with the agencies with jurisdiction for Section 4(f) resources. Refer to Section D.9, Table D-11, for a summary of outreach efforts on Section 4(f) resources to date.

The Final EIS reflects 24 possible alternatives divided over 5 segments, each segment representing unique geographical areas beginning in Seattle and continuing east to connect with Mercer Island, Bellevue, Redmond, and lands in unincorporated King

County. Each alternative has been developed through extensive public and stakeholder input to avoid and minimize effects on resources. Methods of avoidance included adjustments to the horizontal alignment, vertical profile, and placement of facilities, such as traction power substations (TPSS) and maintenance facilities. Proposed mitigation measures were provided for public review and comment during the Draft EIS and the Supplemental Draft (SDEIS). Following the public review process, Sound Transit and FTA worked with each agency with jurisdiction to determine mitigation measures for impacts that could not be avoided and these are described in Table D-1 (found in Section D.4 of this document).

Sound Transit has incorporated measures of avoidance, minimization, and mitigation or enhancement as conditions of the project such that the uses of each park resource would not impact the activities, features, or attributes of the facilities. Based on these measures, FTA and Sound Transit have determined that there are Section 4(f) resources affected by East Link alternatives that qualify for a determination of *de minimis* and, therefore, would not require further Section 4(f) avoidance analysis (see Table D-1 for a summary of project "uses"). The officials with jurisdiction over the resource in the cities of Seattle, Mercer Island, and Redmond and King County, have concurred with FTA regarding impacts and mitigation for Section 4(f) park resources and *de minimis* determinations in their respective jurisdictions (see letters in Attachment D1).

Concurrence with park impacts and mitigation measures for a determination of *de minimis* finding was not reached with the City of Bellevue. As listed in Table D-11, Consultation Summary, Sound Transit has coordinated extensively with the City on the project design, impacts and mitigation regarding Section 4(f) resources throughout the EIS process. The City submitted a letter in October 2008 indicating preliminary concurrence on *de minimis* findings for the Draft EIS alternatives affecting Mercer Slough Park, Surrey Downs Park and the NE 2nd Pocket Parks. A similar letter was not submitted for those additional alternatives evaluated in the SDEIS, including the preferred alternatives in Segments B and C. Most recently, Sound Transit engaged with City of Bellevue parks, transportation and legal staff in several meetings during January 2011 in an effort to come to agreement on mitigation measures allowing a *de minimis* determination for Mercer Slough Park, Surrey Downs Park and the NE 2nd Pocket Parks for all project alternatives affecting these resources. Although there was agreement on some mitigation measures, concurrence was not reached on the mitigation measures necessary to relieve the resources from an impact on their activities, features, and attributes. City staff also indicated that it could not submit a letter concurring with a *de minimis* determination and that City Council approval would be necessary on whether or not to issue a *de minimis* determination for each project alternative. The City Council has not provided Sound Transit or FTA with a determination that impacts on 4(f) resources from any alternative would be *de minimis*. Based on this consultation, FTA and Sound Transit were unable to make a *de minimis* finding for the Section 4(f) resources within the City of Bellevue. Table D-1 describes potential mitigation measures to alleviate park effects in the City of Bellevue. FTA does not have sufficient information to justify making *de minimis* findings for alternatives in Segments B and C. Accordingly, it has not made *de minimis* findings in Segments B and C and will engage in a thorough least harm analysis.

D.5.2 Measures to Mitigate Harm for Historic Resources

For the historic resources, FTA and Sound Transit have engaged similar processes as with the park and recreational resources. FTA and Sound Transit followed the Section 106 process by engaging the SHPO and local jurisdictions, including the City of Bellevue regarding the Winters House and the City of Redmond regarding the Justice White House.

FTA has determined in consultation with SHPO that the East Link Light Rail project would have an adverse effect. The *Preferred Alternative* would result in potential impacts on the Winters House, the potential Surrey Downs historic district, and, if Alternative E 4 were selected, the Justice White House. Through consultation with local jurisdictions and interested parties, minimization and mitigation measures have been developed and incorporated into the project, which resolve the impacts. For the Winters House, the cumulative mitigation measures would result in an improvement to the resource. These mitigation measures are described in Table D-1 in section D.4 of this Section 4(f) analysis.

D.6 Section 4(f) Resource Avoidance Alternatives

The No Build Alternative would avoid uses of all Section 4(f) resources, but it is deemed not prudent per (3)(i) and (3)(ii) under the definition of "feasible and prudent alternative" in 23 CFR 774.17. The No Build Alternative is not prudent per (3)(i) in the 23 CFR 774.17 section because it neither addresses nor corrects the transportation purpose and need that prompted the proposed project.

Under the requirements of 23 USC Section 138, NEPA documents in which the project alternatives involve impacts on Section 4(f) resources must include an analysis of alternative locations for the proposed project that avoid Section 4(f) impacts through rerouting, design changes, or other methods. Such avoidance alternatives must be selected if they are determined to be "prudent and feasible" means of meeting the project objectives. The East Link Project is the combination of one alternative from each of the five segments: Segments A, B, C, D, and E. While the alternatives vary in their routes and associated impacts, they all generally reach the same destinations within a given segment. The alternatives within each segment can generally connect with each alternative from the adjacent segments, with the exception of the alternative connections between Segments B and C. The alternatives in these two segments do not all connect at a common location and some alternatives in Segment B connect with only one or a limited number of alternatives in Segment C.

Following the concurrence with *de minimis* findings on Section 4(f) resources from Cities of Seattle, Mercer Island, and Redmond and King County, no Section 4(f) resources require further Section 4(f) avoidance analysis in Segments A, D or E; however, there is a historic 4(f) resource in Segment E. Therefore, the Section 4(f) resources requiring analysis of avoidance alternatives under Section 4(f) are in Segments B, C, and E.

D.6.1 Segment B/C Avoidance Alternatives Analysis

While the East Link Project is divided into five Segments, Segments B and C present a unique analytical problem for purposes of determining whether there is an alternative that would avoid impacts on Section 4(f) resources. Segments B and C are interdependent, meaning that selecting a route or alignment through one of these two segments would determine the range of alternatives within the other segment. In order to ensure that this analysis considers all reasonable, feasible, and prudent alternatives, therefore, Segments B and C are treated together as a single segment for purposes of the analysis of avoidance alternatives (as well as for the following section of this report, which discusses which alternative causes the least overall harm). All of the combined Segment B-C alternatives have the same southern starting point at the end of Segment A and have common connection points with the Segment D alternatives.

Within Segment B, the potentially affected Section 4(f) resources are Mercer Slough Nature Park and the Winters House. The Section 4(f) resources in Segment C are Surrey Downs Park, NE 2nd Pocket Parks, and McCormick Park.

All combined Segment B-C alternatives analyzed in the EIS would use the Mercer Slough Nature Park. This park is the only resource that would be used by all alternatives; all other Section 4(f) resources in combined Segment B-C can be avoided by one or more alternatives. In order to constitute an avoidance alternative, therefore, an alternative must, at the least, avoid Mercer Slough Nature Park. If there are alternatives that would avoid impacts to Mercer Slough Nature Park, it is not necessary to conduct further analysis of impacts to other Section 4(f) resources since the Section 4(f) regulations require that an alternative that has *no* impacts to Section 4(f) resources be considered to be a feasible and prudent avoidance alternative. The remainder of this section consequently focuses on whether there are feasible and prudent alternatives that avoid impacts to Mercer Slough Nature Park.

D.6.1.1 BNSF Options

Avoidance alternatives were considered that connect to the BNSF Alternative (B7) on the east side of Mercer Slough Nature Park. Because of the size, north-south length and location of Mercer Slough Nature Park, it is not feasible and prudent to design an avoidance route that passes to the east of Mercer Slough Nature Park. The complexity of designing a route to the east of this resource faces the practical reality that the I-90 right-of-way through the park is too narrow in most places to accommodate an alignment on the north or south side of, and within, the existing right-of-way. Any alignment on the north side or on the south side of I-90 would require use of at least some property within Mercer Slough Nature Park. Aligning the route along the south side of I-90 to avoid Mercer Slough Nature Park would also require crossing I-90 twice, substantially increasing project costs and construction impacts to the highway. Moving the route within the I-90 travel lanes is also not feasible because the center reversible HOV lanes that have been designated for light rail use end west of the Bellevue Way interchange and general purpose freeway lanes would need to be displaced to reach the far side of the park. No other alterations to Alternative B7 would totally avoid impacts to Mercer Slough Nature Park. Therefore, any feasible and prudent avoidance alternatives would necessarily have to follow a route to the west of Mercer Slough Nature Park, either along or to the west of Bellevue Way. There are many possible permutations of a route through Segment B to the west of Bellevue Way.

D.6.1.2 Enatai Option

One set of possible avoidance options would travel west of Mercer Slough Nature Park through the Enatai neighborhood. Any alignment through this neighborhood would result in severe disruption to this suburban single-family neighborhood. There is not an existing transportation corridor through this neighborhood that could accommodate the light rail. Routing the light rail through this area would therefore cause significant community impacts as a result of a large number of residential relocations (estimated 70 to 100 single-family homes) and the bifurcation of the neighborhood. Even with mitigation, any avoidance alternative that would bisect this residential area would cause severe disruption to an established community.

D.6.1.3 Bellevue Way Options

All other avoidance alternatives would follow Bellevue Way SE. Each of these alternatives would be elevated in the I–90 center roadway and cross over westbound I–90 in order to preserve the I-90 and Bellevue Way HOV ramps as required by WSDOT. The route would remain elevated along the east side of Bellevue Way to the South Bellevue Station. The station would be located over the west edge of the park and ride adjacent to Bellevue Way SE to provide convenient access to the high volume of pedestrians from the park and ride or bus transfers. North of the station any avoidance alternative would either continue to be elevated on the west side of Bellevue Way (similar to Alternative B2E) or descend to an at-grade profile in the median of Bellevue Way (similar to the Alternative B2A or B3). The avoidance alternative would then turn east on 112th Avenue SE and continue north and avoid Mercer Slough Nature Park.

Similar to the other Segment B alternatives (except Alternative B7), the South Bellevue Station and Park-and-Ride in the avoidance alternatives would include a four-story parking structure with about two stories above the grade of Bellevue Way. However, for the avoidance alternatives the elevated light rail guideway would be located over Bellevue Way north and south of the station and high enough to provide clearance for traffic entering the park and ride or traveling on Bellevue Way. In addition, the station would likely require a mezzanine that would add height such that the station and guideway would be about 15 feet higher than for the other Segment B alternatives and about 20 feet higher than the top level of the parking structure.

There are two different design options for the avoidance alternatives north and south of the South Bellevue Station. The Road Widening Option would place the elevated guideway on piers in the northbound lane of Bellevue Way. This would require repositioning and reconstructing the entire roadway to the west, resulting in removing the majority of dense, mature vegetation and an additional 13 residential property acquisition more than others Segment B alternatives (16 in total) and the need for retaining walls taller than currently proposed for other Segment B alternatives. To avoid shifting Bellevue Way to the west and the associated impacts, the Straddle Bent Option would support the elevated guideway on approximately 23 straddle bents which would span entirely over the existing Bellevue Way right of way. The straddle bents would be positioned approximately every 100 to 120 feet for about 0.5 mile north of the I-90/Bellevue Way interchange; extending north of the South Bellevue Station. The straddle bents in combination with the elevated light rail guideway would create a “rib cage” like effect or viaduct over this section of the road. See Exhibit D-24 for a representative image of a straddle bent. Due to the position over Bellevue Way, this avoidance option would be at least 15 feet higher than the other Segment B alternatives.

Straddle bents consist of double column piers with a beam on top to straddle over the roadway (or other obstacle) to support the elevated light rail guideway in the air.

The avoidance alternatives that require an elevated route along (or to the west of) Bellevue Way would cause unique problems. These problems, outlined below, while perhaps individually minor, cumulatively cause unique problems and impacts of extraordinary magnitude.

- The Straddle Bent Option would restrict the ability to widen the south end of Bellevue Way in the future as it would place a column on either side of the road.
- The Road Widening Option would displace 13 additional residences (than other Segment B alternatives) on the west side of the road.

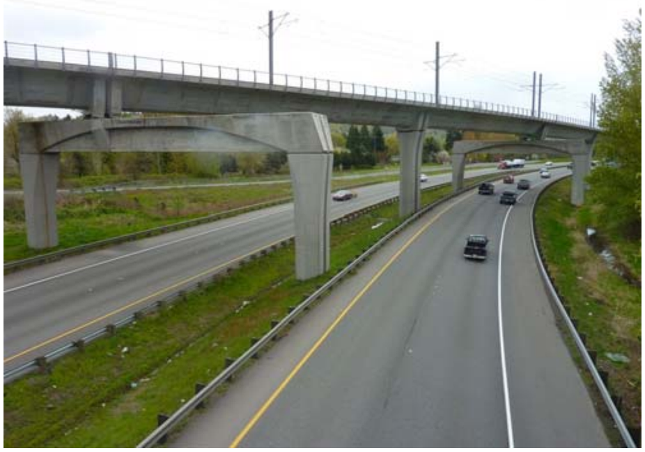

EXHIBIT D-24
Representative Straddle Bents Supporting a Light Rail Guideway

- Visual impacts from I-90 to the South Bellevue Station would be greater than any other Segment B alternatives under either option. The greater height of the station and guideway would make it a more visibly imposing structure and potentially block views of Mercer Slough Nature Park from residents along Bellevue Way, adding visual quality impacts. This alternative would be higher than all previous alternatives by 10 to 15 feet, which would make it more visible from park users. The other Segment B alternatives take advantage of the topography of the South Bellevue Park-and-Ride to lower the height of the station for on looking residents. For the Straddle Bent Option there would be substantially larger visual impacts from the numerous straddle bents across Bellevue Way, from I-90 to north of the station. The long row of straddle bents would create a viaduct over the road and more enclosed experience for travelers on Bellevue Way and be a visual obstruction for residents. Also, the added height would make the light rail infrastructure more visually prominent for park users. In combination, these changes would severely change the visual quality of Bellevue Way. Widening the road to the west for the Road Widening Option would remove most of the mature existing green belt vegetation and require taller retaining walls along west side of Bellevue Way than other Segment B alternatives. Mature vegetation would take several years to replace. The two avoidance options move the light rail closer to the residences west of Bellevue Way SE and would increase potential noise impacts, although mitigation with noise walls would likely address these impacts. However, the walls would increase the visual impact of these options.

- Construction would impede traffic circulation along Bellevue Way SE for longer periods of time than other Segment B alternatives. Shifting the roadway and/or constructing straddle bents over Bellevue Way and near the I-90 interchange would result in longer term traffic restrictions on the primary arterial to I-90 serving the communities of Enatai, Beaux Arts, and Bellevue.

- The costs for the southern portion of the avoidance alternatives would be higher than any other Segment B alternative. The higher costs would be attributed to acquiring and relocating at least 12 more residences than other Segment B alternatives, the straddle bent construction or the additional road widening further west resulting in higher retaining walls, and the higher elevated station. Together these project elements would increase the overall project costs for this portion of the alternative compared with the other Segment B alternatives.

- Finally, stakeholder input and coordination with City of Bellevue has emphasized the need for the alignment to be as far away as practical from residences along Bellevue Way. Per City of Bellevue letter dated February 25, 2008, the City expressed a desire to balance three key principles in South Bellevue: *"provides transit access by facilitating regional and local connections at the South Bellevue Park-and-Ride, protects neighborhoods by placing the line farther away from residences, and minimizes construction impacts by reducing the amount of street reconstruction required along these major transportation corridors."* Contrary to the City's desires, the avoidance alternative would result in longer construction impacts along Bellevue Way SE and place the guideway closer to residences along Bellevue Way SE

- Any avoidance alternative along or west of Bellevue Way would result in higher cost, materially greater construction impacts, residential impacts, noise, and visual effects compared to alternatives that would have relatively minor impacts on Mercer Slough Nature Park. The substantial additional impacts and cost associated with avoidance alternatives along, or to the west of, Bellevue Way must be considered in the context of the small impact to Mercer Slough Nature Park that would result from the Segment B alternatives. The Segment B alternatives with the least effect on Mercer Slough Nature Park would occupy less than an acre of this 320 acre park, which is less than 0.3 percent of the park area. In addition, the affected area is not significant in terms of its character and function relative to the overall natural focus of the park and the guiding objectives and purposes as set forth by the resource managers. The affected areas are near I-90, an 8-lane freeway, adjacent to Bellevue Way SE, a very busy and noisy four lane arterial, and adjacent to the existing South Bellevue Park and Ride that currently contains about 440 parking stalls and substantial bus service. For most Segment B Alternatives along Bellevue Way in the EIS, the affected park area consists largely of open grass, paved sidewalks and paths with some natural vegetation.

Considering how the term "prudent" is defined in applicable FTA regulations, this analysis reveals that there are no feasible and prudent avoidance alternatives to the minor impacts that the project would cause to Mercer Slough Nature Park. Because there is no prudent and feasible alternative to avoid the Mercer Slough Nature Park, then pursuant to 23 CFR 774.3[c]), a Least Harm analysis is required, found in Section D.7.

D.6.2 Segment E Avoidance Alternatives Analysis

Section 4(f) resources in Segment E are not influenced by the connection from Segment D. The prudent and feasible analysis will be confined to alternatives and avoidance alternatives within Segment E. Alternative E4 would be located on the Justice William White House property and would relocate the house. This would cause an impact to the historic context, potentially damage the building, and have a Section 4(f) use. Avoidance alternatives considered in this evaluation consist of relocating Alternative E4 light rail route northeast of the Justice William White House in a new route or selecting another project alternative currently under consideration.

D.6.2.1 Avoidance through New Routes

An avoidance alternative would be feasible by shifting Alternative E4 alignment to the north side of Leary Way before turning south into the former BNSF Railway. Using the same alignment from SR 520, the guideway would be elevated diagonally over the West Lake Sammamish Parkway and Leary Way intersection and crossing Sammamish River in bridge structure before lowering to an at-grade profile adjacent and parallel to Leary Way. To enter into the former BNSF Railway corridor, the guideway would diagonally cross at the Leary Way and NE 76th Street NE intersection, which would stop traffic in all directions. This crossing would require gates and bells. The noise would not affect the Justice White House, as the building is zoned and used as an office building, which is not noise sensitive according to FTA noise criteria.

Shifting the Alternative E4 alignment to the north would avoid the Justice William White House but would permanently affect another 4(f) resource, the Dudley Carter Park. This new alignment would result in the permanent acquisition of approximately 0.12 acre of this park. Also, an open space, which is publicly held by City of Redmond but not officially park lands, would be impacted for approximately 0.5 acres. This land was protected as a heron rookery but the city has recognized that the rookery is not longer occupied. There are no available replacement lands for the park and open space property acquisition in the nearby vicinity. A shift in Alternative E4 would also acquire a condominium building with approximately 15 housing units located just west of the Sammamish River, north of NE Leary Way. Finally, the revised alignment would pass through an undeveloped property on the northeast corner of Bear Creek Parkway and Leary Way, dividing the property and creating an undevelopable remnant. For these reasons listed, this alternative would not be prudent compared to the relocation of the Justice White House.

D.6.2.2 Avoidance by Selecting Another Project Alternative

Preferred Alternative E2, E2 – Redmond Transit Center Design Option, and Alternative E1 would avoid impacts on the Justice White House. They do, however, impact other Section 4(f) resources, but as described in Section D.5, FTA has determined, and the City has concurred, that following mitigation, they qualify for a finding of *de minimis,* meaning there is no remaining harm after mitigation and would not require further Section 4(f) avoidance analysis.

Preferred Alternative E2 is a prudent and feasible alternative because among the avoidance alternatives, it has similar if not lower environmental impacts, least cost, maintains high ridership, and is generally supported by the City of Redmond. The E2 - Redmond Transit Center Design Option would not be prudent because it has the highest business displacements and the highest cost of any avoidance alternative.

While Alternative E1 avoids impacts on the Justice White House, it would not be prudent because it has similar impacts as Alternative E4. With the addition of the highest impact on high-value habitat, it would result in lowering visual quality along West Sammamish Parkway NE and it would be a higher cost alternative.

D.7 Segment B/C Least Harm Analysis

D.7.1 Introduction to Least Harm Analysis

As discussed in Section D.6.1.3, as there is no prudent and feasible alternative to avoid the Mercer Slough Nature Park, pursuant to 23 CFR 774.3(c), a Least Harm analysis is provided here. As concluded in Section D.6, since alternatives from Segments B and C are not independent, and selecting an alternative in one of these segments would affect the range of alternatives in the other, these two segments cannot be reviewed separately, as other segments can. Therefore, Segments B and C are treated together and alternatives within these segments are combined for purposes of this least harm analysis. A project "alternative" as defined in his analysis may consist of an individual alternative within either Segment B or Segment C, or a combined Segment B and Segment C alternative such as *Preferred Alternatives C9T-B2M* and *C11A-B2M.*

D.7.2 Range of Segment B and C Alternatives

The range of feasible and prudent alternatives in Segments B and C consists of the complete set of possible combinations of the feasible and prudent Segment C alternatives with the set of feasible and prudent Segment B alternatives. There are a few alternatives that are not analyzed as combinations in the East Link Final EIS because their impacts are covered by other alternative combinations. However, all possible combinations are analyzed here with additional combinations, including those that are based upon the *Preferred Alternatives C11A* and *C9T* alternatives that connect with Alternatives B2A and B2E. This results in 35 B-C combination alternatives that must be considered, as illustrated in Exhibit D-25 and listed in Table D-7.

D.7.3 Outline of Analysis of Least Harm as Required by FTA Regulations

In Segments B and C, there is no prudent and feasible alternative that avoids any use of Section 4(f) resources. Therefore, pursuant to 23 CFR 774.3(c), the FTA may approve only the alternative that causes the "least overall harm" in light of the purposes of Section 4(f). The regulations require that determining which alternative causes the least overall harm be based upon an assessment and balancing of seven factors:

1. The ability of the alternative to mitigate adverse impacts to each Section 4(f) property (including any measures that result in benefits to the property)
2. The relative severity of the remaining harm, after mitigation, to the protected activities, attributes, or features that quality each Section 4(f) property for protection
3. The relative significance of each Section 4(f) property
4. The views of the official(s) with jurisdiction over each Section 4(f) property
5. The degree to which each alternative meets the purpose and need for the project
6. After reasonable mitigation, the magnitude of any adverse impacts to resources not protected by Section 4(f)
7. Substantial differences in costs among the alternatives

There are five resources that have a Section 4(f) use and must be considered in this least harm analysis: Mercer Slough Nature Park, Surrey Downs Park, NE 2nd Pocket Parks, McCormick Park, and the Winters House. All five resources are considered under each of the seven balancing factors below.

D.7.4 Factor 1: The Ability of the Alternative to Mitigate Adverse Impacts to Each Section 4(f) Property (including any measures that result in benefits to the property)

This factor requires an analysis of how the effects of each alternative can be mitigated for each of the five Section 4(f) resources. Table D-8 summarizes the impacts that would occur and mitigation measures that have been proposed as a result of consultation with the appropriate resource managers, including the City of Bellevue and Washington State DAHP; the proposed mitigation is further discussed below by resource. Almost all effects on Section 4(f) resources can be mitigated, and some alternatives would result in a net benefit to the resource after mitigation.

In addition to the ability to mitigate effects on Section 4(f) resources, several alternatives along Main Street in Downtown Bellevue could help facilitate the creation of a vegetated open green space that might support the City of Bellevue's park plan to create a buffer along Main Street for the Surrey Downs Neighborhood (City of Bellevue, 2010). This benefit would result from Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C11A*-B7, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C2T-B2E, C2T-B3, C2T-B7,

C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7. The net impact or benefit for each alternative is discussed under Factor 2 and summarized in Table D-8.

D.7.4.1 Mercer Slough Nature Park

All Segment B and C alternatives would impact the Mercer Slough Nature Park. Permanent acquisition of park land varies, but all alternatives remove less than one percent of the park land area before mitigation. Those alternatives that are along Bellevue Way have common effects and mitigation measures. Only Alternatives *C11A-B2M* and *C9T-B2M* would temporarily close or redirect park uses along Bellevue Way to different points or different parking locations and consolidated trail heads. To the extent possible, activities at the Winters House would be relocated to mitigate the temporary closure of the Winters House during construction. Other alternatives along Bellevue Way (Alternatives *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C1-B1, C2T-B2A, C2T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C8E-B3, C9A-B2A, C9A-B2E, C9A-B3 and C14E-B3) would not result in these impacts.

Land used for the project along the park's west edge provides facilities for active park functions consisting of a retail outlet for the blueberry farm, Winters House (used for events and Eastside Heritage Center and City of Bellevue offices), Sweylocken boat ramp to access Mercer Slough, parking for these uses and for access points to some of the park trails. While located within the park, many of those facilities that would be most affected along the west side of Mercer Slough Nature Park are not core park functions, (such) as a quiet nature park. Any park functions that would have to be modified during construction (trails, park roadway, and parking) would be replaced following construction.

The active uses are not upholding the primary park objectives as discussed later in Factor 3. According to the *Mercer Slough Open Space Master Plan* (City of Bellevue, 1990) one of the top objectives is to "maintain and enhance extensive wetland wildlife habitat." Those alternatives (Alternatives *C11A-B2M*, C1T-B1, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C2T-B2A, C2T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C8E-B3, C9A-B2A, C9A-B2E, C9A-B3, and C14E-B3) along Bellevue Way would permanently remove areas on the west edge of the park, adjacent to Bellevue Way (a busy four-lane arterial lane) where the active uses are concentrated. These alternatives affect wetland buffer areas but only less than 0.5 acre of actual wetlands within Mercer Slough Nature Park.

Those alternatives that cross over the mouth of Mercer Slough north of, and adjacent to, the Mountains-to-Sound Trail and I-90 (Alternatives *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7) would permanently affect natural wetlands and several wetland mitigation sites. Temporary impacts caused by those alternatives that parallel I-90 (Alternatives *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7) would be minimized through construction techniques such as possibly building a trestle over the parks' key natural features (wetland and stream areas); using a gantry crane, or other measures. Further, vegetation would be replanted to fully mitigate construction impacts on natural areas. During construction and subsequent restoration and mitigation period, wetlands functions would be lost for wetlands affected by alternatives connecting with Alternative B7 as listed above.

Impacts caused by Alternatives *C11A-B2M*, C1T-B1, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C2T-B2A, C2T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C8E-B3, C9A-B2A, C9A-B2E, and C9A-B3 would be mitigated by acquiring replacement lands (up to 3 acres) with a natural wetland character.

These proposed replacement lands would support core park functions better than the existing active areas along the park's western edge and would generally be more consistent with the park objectives than the lands that would be displaced by the project. Because the amount of replacement land for these alternatives varies, the net improvement to the park would vary with the amount of replacement lands needed. Lands used from connections from those alternatives that include alternatives with Alternative B7 (Alternatives *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7 and C14E-B7) would be replaced with similar areas as the impacted land for no net change in type of use.

Alternatives *C11A-B2M* and *C9T-B2M* would result in consolidating access points and rebuilding facilities (trails, trail heads, access roads, and parking). Alternatives *C11A-B2M* and *C9T-B2M* would require consolidating two vehicle access points. Alternatives *C11A-B2M* and *C9T-B2M* would not adversely affect Bellevue's planned T-100 trail head at the 112th Avenue SE and Bellevue Way intersection, but they would require that two trailheads be consolidated at

TABLE D-8
Impacts and Mitigation by Section 4(f) Resource[a]

Facility	Impact	Mitigation	Associated Alternative
Parks			
Segment B			
Mercer Slough Nature Park	**Permanent:** Up to 3.0 acres converted to light rail use (a portion of which is aerial easement) Vehicular access to Sweylocken boat ramp modified right-in/right-out Trails relocated Vehicular access to Winters House and blueberry farm combined **Temporary:** 3.6 acres disturbed Construction impacts[a] Parking at Winters House and blueberry farm closed Winters House and blueberry farm retail closed Trails and access points closed	**Permanent:** ▪ Acquire replacement land pursuant to Washington State RCO and Section 6(f) requirements that would be consistent with the natural character of the park. ▪ Have an option to preserve existing vehicle access to Sweylocken boat ramp. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Provide temporary parking for users off Bellevue Way and south of the park-and-ride or as agreed to with the City. ▪ Relocate blueberry farm retail use during construction. ▪ Maintain blueberry farm operations. ▪ Relocate Eastside Heritage Center during construction. ▪ Maintain access or provide detours for trails, and maintain access to Sweylocken boat ramp.	*C11A-B2M* and *9T-B2M*
	Permanent: 0.5 to 1.7 acres converted (includes aerial easements) **Temporary:** 1.6 to 2.6 acres disturbed Construction impacts[b] Certain trail access points closed Access to boat launch revised (Alternative B1 only)	**Permanent:** ▪ Acquire replacement land pursuant to Washington State RCO and Section 6(f) requirements or provide financial compensation as agreed with the City. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed areas to existing conditions. ▪ Maintain access or provide detours for trails, and maintain access to Winters House, blueberry farm, and boat launch where affected as agreed to with the City. ▪ Provide new signal for full access to boat launch (Alternative B1 only).	All other Segment B and C alternatives
Segment C			
Surrey Downs Park	**Permanent:** 0.5 acre acquired North access to park eliminated; south access changed to right-in/right-out only **Temporary:** 0.6 acre disturbed Access restricted Construction impacts [b]	**Permanent:** ▪ Replace impacted acreage with the acquired properties north of the park along 112th Avenue SE and provide landscaping. ▪ Design treatments of the retaining wall and fence along 112th Avenue SE in consultation with the City. ▪ Design and construct a U-turn on 112th Avenue SE at SE 8th Street. Prepare conceptual layout for two northbound-to-southbound U-turn options – one at SE 6th Street and one at Main Street – to accommodate those coming from the south who would want to turn left into the park; the City and Sound Transit would pick one that Sound Transit would design and construct. ▪ Coordinate with the City of Bellevue and community to revise the Surrey Downs Park Master Plan to address the impacted area. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed with the City. ▪ Restore the temporarily disturbed area with landscaping in accordance with the *Surrey Downs Master Park Plan*. ▪ Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public parking and access for scheduled baseball/soccer fields (spring, late summer, and fall) ▪ Provide a barrier or fence adjacent to the main construction area. ▪ Improve south driveway to increase traffic flow prior to closure of the north driveway.	*C11A-B2M*

TABLE D-8 CONTINUED
Impacts and Mitigation by Section 4(f) Resource[a]

Facility	Impact	Mitigation	Associated Alternative
Surrey Downs Park contd.	**Permanent:** 0.5 acre acquired **Temporary:** 0.5 acre disturbed Construction impacts [b]	**Permanent:** ▪ Replace impacted acreage with the acquired properties north of the park along 112th Avenue SE and provide landscaping. ▪ Design treatments of the retaining wall and fence along realigned SE 4th Street in consultation with the City. ▪ Coordinate with the City of Bellevue and community to revise the Surrey Downs Park Master Plan to address the impacted area. **Temporary:** ▪ Provide financial compensation for temporary use of land as agreed with the City. ▪ Restore the temporarily disturbed area with landscaping in accordance with the Surrey Downs Master Park Plan. ▪ Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public parking and access for scheduled baseball/soccer fields (spring, late summer, and fall) ▪ Provide a barrier or fence adjacent to the main construction area. ▪ Improve south driveway to increase traffic flow prior to closure of the north driveway.	*C9T-B2M*
	Permanent: Less than 0.1 to 0.5 acre acquired **Temporary:** 5.7 acres disturbed (Alternatives C2T and C3T from Alternative B2A only) 0.1 to 0.4 acre disturbed (Alternatives C4A, C7E, and C9A from Alternative B2A only) Construction impacts [b]	**Permanent:** ▪ Provide financial compensation or replacement land as agreed with the City. **Temporary (Alternatives C2T and C3T from Alternative B2A):** ▪ Provide financial compensation for use of land as agreed with the City. ▪ Restore landscape after construction to existing conditions or as agreed to with the City. Maintain overall access to the park by providing trail and sidewalk connectivity through detours in coordination with the City. ▪ Maintain public access and parking for scheduled baseball/soccer fields (spring, late summer, and fall) ▪ Provide a barrier or fence adjacent to the main construction area. **Temporary (Alternatives C4A, C7E, and C9A from Alternative B2A only):** ▪ Provide financial compensation for the temporary use of land as agreed with the City. ▪ Restore temporarily disturbed park area to existing conditions.	C4A-B2A, C3T-B2A, C2T-B2A, C7E-B2A, and C9A-B2A
NE 2nd Pocket Parks	**Permanent:** 0.1 acre acquired **Temporary:** 0.3 acre disturbed, partially closed Construction impacts [b]	**Permanent:** ▪ One, or a combination of, the following, as agreed to with the City: — Provide financial compensation as agreed to with the City. — Provide replacement land with an equivalent portion of the project's staging area located on the northeast quadrant of the park. — Enhance entire northwest quadrant of the park as a public plaza in conjunction with the station entrance. **Temporary** ▪ Provide financial compensation for temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed park area to existing conditions. ▪ Preserve pedestrian access to southern park quadrants.	*C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7
	Permanent: Less than 0.1 acre acquired **Temporary:** 0.1 to 0.3 acre disturbed, partial closure Construction impacts [b]	**Permanent (Alternatives C4A and C9A from Alternatives B2A, B2E, and B3 only):** ▪ Provide financial compensation or replacement land as agreed to with the City. **Permanent (Alternative C8E from Alternatives B3 and B7 only):** ▪ Provide financial compensation or replacement land as agreed to with the City. ▪ Add visual and aesthetic design measures, as agreed to with the City. **Temporary:** ▪ Provide financial compensation for the temporary use of land as agreed to with the City. ▪ Restore temporarily disturbed park area to existing conditions. ▪ Preserve pedestrian access to southern park quadrants.	C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, C8E-B7, C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7

TABLE D-8 CONTINUED
Impacts and Mitigation by Section 4(f) Resource[a]

Facility	Impact	Mitigation	Associated Alternative
McCormick Park	**Permanent:** 0.2 to 0.9 acre acquired, net gain of 0.1 to 0.7 acres for Alternatives C3T, C4A, and C8E **Temporary:** 0.8 to 1.8 acres disturbed Construction impacts [b]	**Permanent:** ▪ One or more of the following measures would be implemented: — Acquire replacement land for permanent use impacts (results in net increase in park land for some alternatives). — Provide financial compensation for use during construction. **Temporary:** ▪ Restore disturbed area after construction.	C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7
Historic Properties			
Segment B			
Winters House	**Permanent:** Use of property between the structure and Bellevue Way SE for lidded retained-cut structure; Potential groundborne noise impact **Temporary:** Potential for vibration and settlement impacts during construction Winters House activities closed Construction impacts [b]	**Permanent:** ▪ Incorporate standard methods of vibration reduction, such as resilient fasteners or ballast mats into the project. A floating slab would be incorporated as necessary to reduce the level of groundborne noise and eliminate the impact. ▪ Landscape the area of property between the front (west elevation) of the Winters House and Bellevue Way SE to more closely reflect the landscaping of the historic period, in consultation with the City. ▪ Provide new interpretive displays on or near the property. **Temporary:** ▪ Photograph and inventory the building to establish existing conditions. ▪ Install vibration and settlement monitoring devices and adjusting excavation methods based on monitoring results. ▪ Use specific vibration and settlement reducing construction methods (to be determined during final design and construction). ▪ Potentially build a construction barrier around Winters House to prevent damage and minimize dust. ▪ Apply dust control measures during construction to minimize dust (after construction, Sound Transit will clean the outside of the building and windows in a manner sensitive to the resource). ▪ Close the Winters House during construction and temporarily relocating the tenant (Sound Transit will provide information to the public regarding how to access the Eastside Heritage Center during construction). ▪ If damage does occur, make the needed repairs consistent with the U.S. Secretary of the Interior's standards for treating historic properties.	*C11A- B2M* and *C9T-B2M*

[a] The residual impacts after mitigation are discussed in Factor 2.

[b] Construction impacts might include impacts such as removed landscape, dust, noise, and/or traffic detours. For historic properties, the setting might be temporarily changed.

FTA	Federal Transit Administration
NRHP	National Register of Historic Places
RCO	Washington State Recreation and Conservation Office

other points along Bellevue Way. Additionally, north of the park and ride, the guideway for Alternatives *C11A-B2M* and *C9T-B2M* would be lower than other alternatives that travel along 112th Avenue SE, thus resulting in less visual change. None of the alternatives would displace active uses.

Collectively, the mitigation measures for all alternatives would fully mitigate the changes to the park, be consistent with core park functions and objectives, and all except *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7 alternatives would expand natural areas where replacement lands are needed. There is no unmitigated harm to park resources for any alternative that affect Mercer Slough Nature Park.

D.7.4.2 Surrey Downs Park

Neither the alternatives connecting from Alternatives B2E, B3, and B7 (Alternatives *C11A*-B2E, *C11A*-B3, *C11A*-B7, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C2T-B2E, -B3, C2T-B7, C3T-B2E, C3T-B3, C3T-B7, C4A-B2E, C4A-B3, C4A-B7, C7E-B2E, C7E-B3, C7E-B7, C8E-B3, C8E-B7, C9A-B3, C9A-B2E, C9A-B7, C14E-B3, C14E-B7) nor Alternative C1T-B1 would affect Surrey Downs Park.

Alternatives C2T-B2A and C3T-B2A would temporarily use the northern half of Surrey Downs

Park (where the King County District Courthouse is located) as a staging area to construct the tunnel portals. Following construction, removing the King County District Courthouse and replacing the site with landscaped park grounds would have a net benefit to Surrey Downs Park—if it is not already removed at the time of East Link construction—and would help facilitate implementing the City of Bellevue's *Surrey Downs Master Plan* (City of Bellevue, 2009) to redevelop the park facility. Disturbed lands would be restored to existing conditions or as agreed to with the City. However, depending on the park development schedule, construction staging at this location might delay implementing the newly funded master plan for Surrey Downs Park.

Alternatives *C11A*-B2A, *C9T*-B2A, C4A-B2A, C8E-B2A, and C9A-B2A would acquire small slivers of park property along the eastern edge of Surrey Downs Park for the adjustments to 112th Avenue SE right-of-way in order to preserve operations on this heavily traveled four-lane arterial. This impact would remove only landscaping and no recreational uses. Disturbed lands would be restored, and removed lands would be mitigated with financial compensation or replacement lands of similar function and value. Replacement lands that would mitigate for the impacts of Alternatives *C11A-B2M* and *C9T-B2M* would extend the park by continuing it along the west side of 112th Avenue SE from the park north to Main Street.

Alternative *C11A-B2M* would eliminate the north vehicle access, but the south vehicle access would be modified to right-in and right-out and U-turn capabilities along 112th Avenue SE would preserve park vehicle access needs. For Alternative *C9T-B2M*, vehicle access at the north end of the park would be closed and a new alignment for SE 4th Street would connect through a corner of the park from SE 6th Street. The access at SE 6th Street would be signalized to provide a safe access into Surrey Downs neighborhood. This option may require up to 0.5 acres of the park. A second option would provide a connection into the Surrey Downs neighborhood at SE 9th Street from the south park entrance. Access to the neighborhood from the south park entrance would permanently close the north entrance reducing park impact, but it would result in changing circulation patterns in the neighborhood. Since none of the alternatives negatively affect active recreational uses in this park, no mitigation is necessary for these park functions.

D.7.4.3 NE 2nd Pocket Parks

Portions of all quadrants of the NE 2nd Pocket Parks may be closed temporarily during construction for Alternatives C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, C8E-B7, C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7 and three might be closed for Alternatives *C9T-B2M*, *C9T*-B2A, *C9T*-B3, and *C9T*-B7. These impacts would be temporary, and financial compensation would be provided as compensation or for use of the park land as agreed to with the City.

Alternatives *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, and *C9T*-B7 would use one quadrant of the parks for a permanent entry into the Bellevue Transit Center tunnel station. The station entrance would be incorporated into the northwest quadrant of the park, measuring approximately 0.1 acre. This use would be consistent with the intended use of the parks. Additionally, a portion of the property planned to be used for staging adjacent to the northeast quadrant could be used to create new park area as a replacement. Alternatives C8E-B3 and C8E-B7 would result in a permanent elevated guideway over the parks, creating a visual intrusion. Beyond visual treatments to the columns, no mitigation is needed for this impact because these parks contain no recreational facilities and serve principally as neighborhood open space in an urbanized neighborhood; the parks would likely continue to operate as they do currently. Use of the parks by Alternatives *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7 would be mitigated with replacement park property or financial compensation and Alternatives C8E-B3 and C8E-B7 would be mitigated with visual and aesthetic design measures to integrate the guideway into the park.

Alternatives *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, C8E-B7, C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7 would cause no additional impact to the NE 2nd Pocket Parks. No other alternative would affect the pocket parks.

D.7.4.4 McCormick Park

Only Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7 would affect McCormick Park and result in a permanent visual impact or changes in access even after mitigation. Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, and C4A-B7 would result in a net increase in park acreage following construction and after disturbed landscaping and associated amenities are replaced. Alternatives C8E-B3 and C8E-B7 would not enlarge the park, but net useable acreage would remain unchanged. Large conifers, which act as a visual buffer and aesthetic amenity, would be affected by

Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7. Because the removed trees are mature, the impact of removing these trees will take many years to mitigate. These alternatives would result in the permanent presence of portions of at-grade, retained-fill and/or elevated light rail guideway within the park area. These profiles would limit access to portions of the park and would diminish the amount of uninterrupted greenery that serves as a buffer to the urban core.

D.7.4.5 Winters House

Measures to avoid potential construction impacts on the historic structure from Alternatives *C11A-B2M* and *C9T-B2M* are incorporated into the project construction methodology. Among these measures would be construction techniques such as ground improvement, underpinning the building, and shallow supporting walls; directions that contractors shall begin trench construction at the furthest distance from the house; conducting settlement and vibration monitoring; and anticipating and implementing corrective measures to avoid impacts on the structure. These measures would avoid damage to the structure's unique characteristics and features. If damage did occur Sound Transit would make repairs consistent with the U.S. Secretary of the Interior's standards for treating historic properties. In addition, the existing tenant and other uses of the building would be relocated during construction to avoid disturbing their activities. Potential groundborne noise impacts during operation of the light rail would be mitigated with special vibration reducing track-work incorporated into the project.

The Winters House today sits adjacent to a busy urban vehicular thoroughfare. Over time, landscaping that would preserve the context of the structure has gradually been lost or compromised with expansion of Bellevue Way and changes to the landscaping. The proposed mitigation for the Winters House would improve its visual and physical context. Following construction, and in consultation with the DAHP and the City of Bellevue more historically appropriate landscaping would be planted over the lidded retained-cut with a net benefit to the historic home. The Winters House today lacks sufficient or appropriate signage providing information about its history and historic significance. Sound Transit would also provide new interpretive signage at the house in coordination with City of Bellevue staff.

D.7.4.6 Conclusions: Factor 1

Most, but not all impacts to Section 4(f) resources could be effectively mitigated under most alternatives. The principal impact that could not be mitigated would be the visual impact of the guideway structure on McCormick Park as a result of Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A- B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7.

In addition to mitigation, there would be net benefits to Section 4(f) resources from several alternatives. Alternatives *C11A-B2M* and *C9T-B2M* would produce net benefits for the Winters House in the form of enhanced landscaping and new interpretive signage. Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C1-B1, C2T-B2E, C2T-B2A, C3T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C9A-B2A, C9A-B2E, C9A-B3, and C14E-B3 would produce a net benefit for the Mercer Slough Nature Park because replacement lands would be more consistent with the park's objectives than the areas affected.

D.7.5 Factor 2: The Relative Severity of the Remaining Harm, after Mitigation, to the Protected Activities, Attributes, or Features that Qualify Each Section 4(f) Property for Protection

The purpose of this factor is to assess the remaining effects on Section 4(f) resources after efforts to avoid, minimize, and mitigate project effects as described under Factor 1. The following discussion analyzes the severity of the remaining harm to each Section 4(f) resource. In the weighing that is required for least harm analysis, the severity of any remaining harm to Section 4(f) resources needs to be considered carefully. Where all impacts to a particular Section 4(f) resource can effectively be mitigated, the absence of remaining harm is especially important. Where there are impacts that cannot be mitigated, it is important to consider whether those impacts are significant within the context of the purpose, goals, plans, and other resource management objectives for the particular Section 4(f) resource. All impacts are not treated alike and are evaluated in this analysis within the context of each resource.

D.7.5.1 Mercer Slough Nature Park

All impacts on Mercer Slough Nature Park would be fully mitigated. Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C1-B1, C2T-B2, C2T-B2A, C3T-B2E, C2T-B3, C3T-B2A, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C9A-B2A, C9A-B2E, C9A-B3, and C14E-B3would produce a net benefit for this park because they would provide replacement land equivalent to land permanently occupied by the project (up to 3 acres) to the Mercer Slough Nature Park. The replacement lands would be natural areas, which are more consistent with the park core objectives and role than the active areas that would be affected by these alternatives. The impacts from all other alternatives would be fully mitigated, but there would be no net benefit to the park.

D.7.5.2 Surrey Downs Park

All impacts to this resource would be fully mitigated. As demonstrated under Factor 1, effects on Surrey Downs Park from Alternatives *C11A-B2M*, *C9T-B2M, C11A*-B2A, *C9T*-B2A, C2T-B2A, C3T-B2A, C4A-B2A, C7E-B2A, and C9A-B2A would be mitigated. Replacement lands for impacts caused by Alternatives *C11A-B2M* and *C9T-B2M* would extend the existing park along the west side of 112th Avenue SE from the park (approximately SE 6th Street) to Main Street. Depending on final input from City of Bellevue, changes in neighborhood access through the north end of the park for C9T-B2M could be redesigned through the south park entrance to reduce park land impacts while also maintaining overall access to the park from 112th Avenue SE. Alternatives C2T-B2A and C3T-B2A would have a net benefit to Surrey Downs Park if they removed the King County District Courthouse, which is presently sited within the park but does not contribute to the park's core objectives. Small slivers of property needed for Alternatives C4A-B2A, C7E-B2A, and C9A-B2A would be mitigated with financial compensation and landscaping. No other alternatives would directly affect Surrey Downs Park.

D.7.5.3 NE 2nd Pocket Parks

There would be no remaining harm after mitigation to the NE 2nd Pocket Parks. Because this resource serves principally as open space, a small reduction (less than 0.1 acre) in park area for several alternatives and visual effects from C8E-B3, C8E-B7 would not change the parks' use or function.

D.7.5.4 McCormick Park

Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7 would result in lasting visual impacts on McCormick Park even after mitigation. There would be a net benefit to the resource as a result of increase in park acreage from mitigation of Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, and C4A-B7. There would be no net benefit for this resource from Alternatives C8E-B3 and C8E-B7.

D.7.5.5 Winters House

All impacts to this resource from Alternatives *C11A-B2M* and *C9T-B2M* would be effectively mitigated through vibration reducing track-work, new landscaping that would be more consistent with the historic setting of the building, and interpretive signage which are described in more detail in Section 4.16, Historic and Archaeological Resources; and Appendix H4, the *Historic and Archaeological Resources Technical Report*. The landscaping and interpretive signage would also result in a net benefit, which would not be realized from the other alternatives. The potential for temporary construction impacts would be mitigated through construction methods and relocating the tenant during construction. All other alternatives avoid impacts to the Winters House.

D.7.5.6 Conclusions: Factor 2

After mitigation, Alternatives *C11A-B2M* and *C9T-B2M* would result in no remaining harm and have a net benefit to Mercer Slough Nature Park and the Winters House. Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C1-B1, C2T-B2E, C2T-B2A, C3T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C9A-B2A, C9A-B2E, C9A-B3, and C14E-B3 would result in no remaining harm and create a net benefit to Mercer Slough Nature Park through replacement lands that contribute to park objectives. A net benefit to Winters House would result from Alternatives *C11A-B2M* and *C9T-B2M.* There would be no remaining harm from *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7 alternatives, but also no benefits. After mitigation, there would be remaining impacts on McCormick Park from Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7.

D.7.6 Factor 3: The Relative Significance of Each Section 4(f) Property

This factor is intended to evaluate all of the affected Section 4(f) resources on a comparative basis. This factor does not address the impacts on each resource but rather is intended to help assess whether certain resources are of greater significance than others. This analysis is necessarily qualitative and requires an element of judgment since it requires comparing unlike resources and their relative and comparative value to the community.

It is useful for this analysis to understand that the City of Bellevue prides itself on being a city within a park. With a current population of approximately 110,000, parks and open space resources are a highly valued commodity for this community. Each recreational facility that would potentially be affected by the project has a unique function and value to this community. While the City of Bellevue has formally indicated each affected park is significant (and therefore eligible for protection under Section 4(f)), the relative significance of each resource is not identical. For example, Mercer Slough Nature Park has a broad regional significance, whereas Surrey Downs Park serves primarily as a community recreational function and McCormick Park and the NE 2nd Pocket Parks have a far more localized importance for just the adjacent neighborhoods. The Winters House is significant because it is the only historic resource listed on the NRHP within the City of Bellevue.

D.7.6.1 Mercer Slough Nature Park

The Mercer Slough Nature Park, located between Bellevue Way SE and 118th Avenue SE directly north of I-90, is a 320-acre community park characterized by wetland systems and upland habitat for most of the park and the Environmental Education Center on the park's east side. Mercer Slough Nature Park is surrounded by a highly urbanized environment, with large freeways and developed residential and business districts. With few missing pieces, Mercer Slough Nature Park is a large contiguous open space offering an accessible environment for passive recreation where visitors feel removed from the urban environment and observe wildlife. The size of this relatively natural environment provides a protected ecosystem from urban development. The 320-acre size and topography separates the park from adjacent lands uses and thick vegetation blocks views and offers a feeling of separation from the busy roadways and freeways that surround the park. The Mercer Slough Nature Park is a regional as well as a local resource; it defines the entrance and the context for South Bellevue.

As a regional resource, this park attracts a broad range of users from throughout the east side of the metropolitan area. Its size and ecological role makes the Mercer Slough Nature Park considerably more significant (both absolutely and relative to the other affected resources) than the other potentially affected resources within the project area.

The importance and future plans for the park are recorded in the Bellevue Parks Master Plan (City of Bellevue, 2010). Also, as stated in the *Mercer Slough Open Space Master Plan Environmental Impact Statement* (City of Bellevue, 1990), park objectives consist of the following:

- Maintain and enhance the extensive wetland wildlife habitat.
- Provide environmental education and awareness and maintain and diversify Bellevue's agricultural heritage.
- Participate in regional and national efforts to understand wetland ecosystems through research in restoration enhancement techniques.
- Provide passive recreational opportunities in harmony with natural system preservation.
- Maintain and protect important views and open space values.

It is important to note that these objectives focus on the park's ecological and passive recreation benefits and place relatively less emphasis on active recreation or more intensive uses. Consistent with its role, the park provides wetland habitat, environmental education and awareness, agricultural heritage maintenance, nature observation, and open space with pedestrian trails, a water trail, benches, and interpretive signs. Other activities do take place in the park, including events and meetings at the Winters House, the blueberry farm, agricultural U-pick farm and sales (including fruit and vegetable produce sales, parking for the Winters House, the blueberry farm and trails) the South Bellevue Transit Center park-and-ride, and the Sweylocken boat ramp. These functions, while important, are not as closely aligned with the principal goals and purposes of this resource and are, therefore, not as significant. Most of these active uses and ancillary facilities are located on the west side along Bellevue Way.

D.7.6.2 Surrey Downs Park

Surrey Downs Park contains active park uses such as ballfields, a play structure, internal trails, open space, the King County District Courthouse, and associated parking. Approximately 4.9 acres of the 11.4-acre site are currently used as park, with the remainder occupied by the King County District Courthouse. The courthouse is not consistent with the objectives of this resource and detracts from its significance and value.

In March 2009, the City of Bellevue adopted the *Surrey Downs Park Master Plan* for redeveloping the park. Proposed improvements include new baseball fields, open space, a community garden, parking, and a recreational building. A levy to approve funding to implement the master plan was approved by Bellevue voters in fall 2009.

This park is important as a neighborhood park and as a larger community baseball and soccer recreational resource. Per the City of Bellevue Parks Master Plan, the Surrey Downs Park's focus of its significance is on active, community-based recreation. Other uses are less important or detract from its value (e.g., the courthouse) as confirmed with the *Surrey Downs Park Master Plan*, which plans to remove the Courthouse.

D.7.6.3 NE 2nd Pocket Parks

The NE 2nd Pocket Parks are located at the four corners of the intersection of NE 2nd Place and 110th Avenue NE. These small, undeveloped areas function primarily as visual green space. There are limited facilities for public use of these parks. Bellevue proposes to expand and develop these parks under Bellevue's *Downtown Implementation Plan* (City of Bellevue, 2004) and the *Bellevue Parks & Open Space System Plan* (City of Bellevue, 2010); however, no property has been purchased or plans developed for this expansion. These parks have grass, with hedgerows that encircle the grass area preventing easy access. A few benches are positioned along the perimeter of the park quadrants, facing the sidewalks. As a result of this landscape pattern, this resource is often used as an informal off-leash pet area.

Notwithstanding the lack of facilities, small parklands in urbanized areas provide visual relief and an element of greenery and repose within the urban environment. While these parks are a Section 4(f) resource, their role is limited to serving a localized population, and they are not significant beyond the immediately adjacent community. Given Bellevue's decision not to develop or implement specific plans for enhancing these parks, it is reasonable to conclude that their relative significance is less than some of the other park resources in the project area to which Bellevue has made a substantial financial commitment.

D.7.6.4 McCormick Park

McCormick Park is located along the north side of NE 12th Street at the north end of the Segment C boundary. The park, which extends from 107th to 112th Avenue NE, is a neighborhood park with trails, art features, and picnic benches that provide a buffer between the established single-family residences to the north (Northtowne neighborhood) and high-density residential and commercial uses to the south in the downtown core. The topography undulates with berms and a meandering path. The vegetation is mature, including tall evergreens that separate the park and the residences to the north. The park does not provide any active recreational activities or facilities. Roads to the neighborhood and a pedestrian crossing separate some of the park segments. This park is used by nearby residents and workers in the area and persons walking or exercising their pets. While this park is a Section 4(f) resource, it is reasonable to conclude that its significance is limited to a local population and is not significant for the larger community.

D.7.6.5 Winters House

The Winters House is the only structure in the city of Bellevue registered on the NRHP. It has a role in the development and history of Bellevue and is recognized by the community as an important resource. The Eastside Heritage Center has made this its headquarters from which it operates a heritage research center, exhibit space, and archive and library. The Eastside Heritage Center uses the facility for meeting space, tours, and other events (such as weddings or other events). Because of the varied uses to which this center puts this resource, its significance extends beyond its historic attributes. In addition, its unique role as the only NRHP-listed resource in the city means that this resource is significant beyond the immediately adjacent community.

D.7.6.6 Conclusions: Factor 3

This factor provides insights about the relative significance of each Section 4(f) resource. Mercer Slough Nature Park and the Winters House clearly have the greatest significance of all the potentially affected Section 4(f) resources and the NE 2nd Pocket Parks, Surrey Downs Park, and McCormick Park have relatively less significance.

D.7.7 Factor 4: The Views of the Official(s) with Jurisdiction over Each Section 4(f) Property

The purpose of this factor is to help provide a basis for judging the relative importance of each Section 4(f) resource and the relative significance of potential impacts to these resources based on the jurisdiction's point of view. Only two entities have jurisdiction over the Section 4(f) resources that would be potentially affected by the project in Segments B and C: the City of Bellevue and DAHP. The following analysis explains positions that these agencies have taken with regard to the potentially affected resources providing insights on how to integrate the views of these jurisdictions into this Section 4(f) analysis.

D.7.7.1 City of Bellevue

Sound Transit and the City of Bellevue have been working closely to develop the project in a manner that both meets the East Link Project purpose and also respects the City of Bellevue planning goals. Since the City has been deeply involved in evaluating and selecting alternatives, the City's views on the preferred alternative for the East Link project are important because they reflect the City's own balance of competing (and often contradictory) needs and goals.

Bellevue Views on Alternatives

It is important for purposes of this analysis to review the history of the City's involvement in selecting alternatives for Segments B and C and the views that the City has expressed to Sound Transit. A series of letters and correspondence beginning with the release of the Draft EIS is a useful foundation for understanding the City's views on impacts to Section 4(f) resources within the City's jurisdiction.

Following the release of the Draft EIS, the City of Bellevue submitted its preference for an alternative that resembles alternative C2T-B3, including the 114th Design Option, (with modifications referred to as alternative B3S) in a letter dated February 25, 2008. Bellevue's letter stated the following:

> *"The City's preferred routing decisions are the result of careful study and significant public discussion….over three years in review, planning, outreach and deliberation. This B3S balances three key principles in South Bellevue: provides transit access by facilitating regional and local connections at the South Bellevue Park-and-Ride, protects neighborhoods by placing the line farther away from residences, and minimizes construction impacts by reducing the amount of street reconstruction required along these major transportation corridors. For land use, C2T allows Downtown Bellevue to continue to accommodate regional growth and helps realize local land use potential east of I-405 in Wilburton."*

This letter demonstrates the importance that the City places on ensuring that the project serves the South Bellevue Park-and-Ride market, tunneling through Downtown Bellevue, serving the Wilburton area east of I-405, and minimizing neighborhood and traffic impacts, and these continue to inform the City's preferences as they have evolved between 2009 and 2011. These views are important since the City is also the entity with jurisdiction over all potentially affected Section 4(f) park resources.

The City's February 2008 recommendation was based on the following City of Bellevue light rail policy principles:

- Connect "somewhere to somewhere" by conveniently serving the places where people live, work, and play
- Accommodate long-term, multimodal transportation system development
- Optimize ridership
- Consider construction impacts and risks
- Protect environmentally sensitive areas
- Advance the long-term land use vision by serving existing and planned concentrations of employment and population

Bellevue's suggested alternative for Segment B in South Bellevue requires shifting Alternative B3 from the center to the east side of Bellevue Way to reduce construction effects on the arterial and to increase separation from the Enatai neighborhood. The City's suggestion also included routing the alternative to the east at SE 8th Street in order to avoid widening the street to the north where the 112th Avenue SE right-of-way becomes more constrained.

It is important to note that the City letter acknowledges that the proposed alternative might increase impacts to Mercer Slough Nature Park (including wetland impacts) but stated that mitigation opportunities exist within Mercer Slough. The letter also stated, "The Winters House may need to be relocated in order to accommodate this alternative. Based on preliminary assessment, the Council believes this is feasible and the relocation costs could be offset by the cost savings of this modification." These statements indicate the City's concurrence that impacts to these two Section 4(f) resources can be appropriately mitigated and that, with such mitigation, impacts are acceptable.

In Downtown Bellevue (Segment C), the City has recognized that the ST2 Plan does not provide funding for the tunnel alternatives and has stated, "We are committed to being an active partner with Sound Transit to identify potential cost saving measures and additional funding resources to ensure the City's preferred alternatives can be implemented and the system is build to support the regional vision" (City of Bellevue Letter, 2008). The letter also states that another reason that the City prefers alternative C2T with its crossing of I-405 at NE 6th Street is because it avoids the permanent and adverse effects on McCormick Park that would occur with an alternative that exits downtown at NE 12th Street.

On May 12, 2009, the City sent another letter to Sound Transit stating its opposition to the surface Alternative C4A through downtown because of potential traffic impacts. The letter requested further engineering on a tunnel alternative, which also serves the Wilburton neighborhood, and reiterated the City's commitment to continue working with Sound Transit on tunnel funding.

Based upon the City's continued strong interest in a downtown tunnel alternative and a willingness to consider both cost-savings measures and additional funding, Sound Transit conducted a peer review of the tunnel options to seek the lowest-cost tunnel options. The peer review led to the development of *Preferred Alternative C9T*, which would be significantly less expensive than previous tunnel alternatives and also addresses the City's preference for service to the Wilburton neighborhood. Sound Transit also conducted a value analysis review of the entire East Link corridor, which recommended that a 112th Avenue NE alternative be used into Downtown Bellevue as a means to further reduce project costs.

On February 10, 2010, the City Council and Sound Transit Board held a joint workshop to review the tunnel alternative (*Preferred Alternative C9T)*, two new at-grade options through downtown (Alternative C9A and Preferred Alternative *C11A*), and an elevated option (Alternative C14E) proposed by the City. All of these new alternatives address the City goal of serving the Wilburton redevelopment area east of downtown. The workshop also reviewed the potential cost savings and changes in impacts associated with following 112th Avenue NE into Downtown Bellevue.

Following the workshop, the City issued a letter on March 24th, 2010, changing its preference from Alternative C2T to the newly created *Preferred Alternative C9T* and requesting that Sound Transit explore further design modifications. On April 19, 2010, the City Council took another step in support of *Preferred Alternative C9T* by authorizing the City Manager to execute a term sheet with Sound Transit for including the tunnel as a preferred alternative in the East Link Project Final EIS. The term sheet outlined a funding strategy for *Preferred Alternative C9T* in which the City would contribute up to $150 million in additional funding, Sound Transit would identify in $75 million in scope reductions, and Sound Transit would identify $95 million in additional funding (all in 2007 dollars).

While work progressed on developing and funding *Preferred Alternative C9T*, the City reexamined its preferred alternative in South Bellevue (Segment B). On January 26, 2010, the City sent a letter asking for evaluation of a modified Alternative B7 that would "…expand the South Bellevue Park-and-Ride lot to the south … then cross the Mercer Slough Nature Park, before heading north on the BNSF…" The U.S. Department of Interior subsequently expressed significant concern about this proposed alternative in correspondence with the City. On March 9, 2010, the City withdrew its January 26 request and stated that its new preferred alternative is the original Alternative B7.

After the term sheet on the tunnel alternative was executed, Sound Transit updated its preferred alternative to include the *Preferred Alternative C9T* alternative and also the 112th Avenue SE alternative rather than the Alternative B7, consistent with the term sheet commitment to identify scope reduction. On May 6, 2010, the City sent Sound Transit a letter reiterating the City's preference for Alternative *C9T*-B7 and committing to working with Sound Transit to achieve the principles outlined in the term sheet. This was a clear change in direction on the part of the City from previous discussions about facilitating a tunnel in Downtown Bellevue through saving costs in Segment B.

After Sound Transit had identified the 112th Avenue SE alternative as its preferred alternative, the City collaborated with Sound Transit on an extensive design and outreach process. Throughout this process, Sound Transit and City staff made it clear to the public that while 112th Avenue SE is not the City's preferred alternative, it might ultimately be selected by Sound Transit as the preferred alternative. In July 2010, the Sound Transit Board refined the preferred alternative on 112th Avenue SE (*Preferred Alternative B2M*) to incorporate a westside alternative recommended by residential and business owners along the portion of the 112th Avenue SE right-of-way that is most constrained.

On July 20, 2010, the City sent another letter to Sound Transit. This letter stated the City's opposition to *Preferred Alternative B2M*. The concerns raised include displacements, noise impacts, construction impacts, impacts to historic properties, and traffic impacts. The letter also raised concerns about the potential for negative impacts on the historic character and use of the Winters House.

The July 2010 letter restated the City's support for Alternative *C9T*-B7 but proposed a series of design modifications. The letter acknowledged that a principal objection to Alternative B7 is the lack of service to the South Bellevue Park-and-Ride. The City, therefore, requested review of an option developed by the City to relocate the park-and-ride south to the I-90/Bellevue Way interchange. Reports prepared by City consultants and attached to the July 2010 letter indicated that relocation of the park-and-ride would add costs to Alternative *C9T*-B7 alternative and would have greater impacts on the Enatai neighborhood than alternatives that retain the park-and-ride in its current location.

After Sound Transit declined further study of the City's proposed Alternative *C9T*-B7 design modifications based on cost, risk, and impacts, the City hired its own consultant to review some of its proposed modifications to the alternative that it now refers to as Alternative B7R. In its January 2011 comment letter on the Supplemental Draft EIS, the City stated that its goals are to "minimize negative impacts, reduce costs, and ensure high ridership as compared to [alternative] *B2M*." Initial analysis, however, indicates that the City's Alternative B7R is likely to have different but not fewer impacts, similar ridership, and significantly greater cost. As with Alternative *C9T*-B7, the City's Alternative B7R would impact both Mercer Slough Nature Park and the NE 2nd Pocket Parks.

Conclusions from City's Input

For purposes of the current analysis, several relevant conclusions can be drawn from the lengthy history of the City's involvement in evaluating alternatives through Segment B and C.

First, based on the October 21, 2008 letter, the only Section 4(f) resource that the City has found to be permanently and adversely affected is McCormick Park, which would be affected by most of the alternatives exiting Downtown Bellevue along NE 12th Street (Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7).

Second, the City clearly views Mercer Slough Nature Park as an important regional park resource. Nevertheless, the City appears to indicate that mitigation is appropriate for all of the potential impacts and that none of the potential impacts is so severe as to interfere with the fundamental goals and objectives for each Section 4(f) resource. The City has recommended four alternatives in South Bellevue (Segment B), all of which would adversely affect the park; one alternative passes along the west edge of the park adjacent to Bellevue Way (Alternative B3S), one passes along the south edge of the park by I-90 (Alternatives B7 [as well as their B7R proposal]), and one actually transects the middle of the park from the South Bellevue park-and-ride to the former BNSF Railway corridor. In February 2009, the City specifically asserted that mitigation opportunities are appropriate within Mercer Slough Nature Park for the impacts created by an alternative along the east side of Bellevue Way and adjacent to the park.

Third, the City presents a varied view about affecting the Winters House. While their February 2009 letter provides that avoiding the Winters House property is not essential so long as impacts to this resource are fully mitigated and the City even suggested moving the Winters House if necessary to mitigate impacts of the alternative it proposed, the City's July 20, 2010 letter raises concerns about impacts to the Winters House (and other impacts)

Fourth, the City's comments on Surrey Downs Park and the NE 2nd Pocket Parks have been limited to technical comments from staff regarding mitigation. While the 112th Avenue SE alternative that the City currently opposes would adversely affect Surrey Downs Park, the reasons cited by the Bellevue City Council for opposition to 112th Avenue SE have focused primarily on neighborhood noise, traffic, and construction impacts and not on impacts to these parks.

In summary, from the record of City correspondence and meetings with Sound Transit staff, there do not appear to be any impacts on Section 4(f) resources in either Segment B or Segment C that the City does not believe can be potentially mitigated. The City views that impacts on Section 4(f) resources from all Segment B and C alternatives can be potentially mitigated. While the City has expressed support for the role played by each potentially affected Section 4(f) resource, the City has also indicated that other considerations, independent of impacts on Section 4(f) resources, are at least as, and generally more important to the City than avoiding impacts to these resources. While the City has shown a recent preference for alternatives based upon Alternative B7, it is important to observe that the City's preference is based upon its own criteria and not based upon an assessment of impacts weighted towards resources protected under Section 4(f).

D.7.7.2 Department of Archaeological and Historic Preservation

Sound Transit and FTA have consulted with DAHP regarding the Winters House throughout the environmental review process, starting with initiating the Section 106 process in August 2006. The Winters House is listed on the NRHP, and DAHP believes it is appropriate to preserve its existing setting and maintain the current integrity and features that support its listing on the NRHP. FTA has determined, in consultation with DAHP, that the project has an Adverse Effect resulting from potential impacts on the Winters House (*Preferred Alternative B2M*), the potential Surrey Downs Historic District (*Preferred Alternative C11A* and Alternatives C4A, C2T, and C3T), and the Justice White House (Alternative E4). Accordingly, a Memorandum of Agreement (MOA) will be prepared stipulating the appropriate mitigation measures. The MOA would also describe benefits to the resource because of measures Sound Transit has committed to implement. This net benefit would not be realized by any other alternative, although the other alternatives would also have no impacts on historic resources. Because its jurisdiction is limited to historic resources, DAHP has not expressed any view on impacts to other non-historic Section 4(f) resources.

D.7.7.3 Conclusions: Factor 4

While the City's preferred alternative has changed several times over the last few years, it is evident that impacts to Section 4(f) resources (and avoiding such impacts) have not been a primary determinant in the City's position. Instead, the City has prioritized serving the South Bellevue Park-and-Ride market (either at the existing location or relocated south), tunneling through Downtown Bellevue, serving the Wilburton area east of Downtown Bellevue, and minimizing traffic and neighborhood impacts as the more important criterion in selecting alternatives than protecting Section 4(f) resources. The only Section 4(f) resource for which the City has found a permanent adverse effect is McCormick Park. Regarding the other Section 4(f) resources, the City has placed a priority on mitigating, rather than necessarily avoiding, impacts. The City effort to balance broader planning objectives and impact concerns with mitigation to Section 4(f) resources in this respect is similar to the objectives of this least harm analysis. In the past, the City has supported Alternatives *C9T*-B7 and C2T-B3 with modifications.

City of Bellevue has recommended a modified alignment for the BNSF Alternative (B7) that incorporates a station near the Bellevue Way SE and I-90 ramps rather than the 118th Station. Bellevue's proposed alignment then connects to *Preferred 110th NE Tunnel Alternative (C9T)* with a tunnel along NE 2nd Street (rather than along Main Street as the current C9T Alternative). These collective revisions to Alternative B7 and *Preferred Alternative C9T* are referred to as the B7R. The City has stated that this is its current proposal for the alignment through Segments B and C for East Link. The B7R variation has not been evaluated in this least harm analysis because there is not complete information on this variation. The alternatives consistent with the term sheet the City signed with Sound Transit are Alternatives *C9T-B2M*, *C9T*-B2A, and *C9T*-B2E. All of these alternatives affect Section 4(f) resources, but as explained in earlier sections of this analysis, the impacts to these resources can all be mitigated.

DAHP views the Winters House as an important resource for historic preservation. An MOA will be developed to describe measures to avoid potential impacts to the Winters House and benefits to this resource.

D.7.8 Factor 5: Degree to Which Each Alternative Meets the Project Purpose and Need

The overarching purpose and need of the East Link Project is to expand the Sound Transit Link light rail system from Seattle to Mercer Island, Bellevue, and Redmond via I-90 and to provide a reliable and efficient alternative for moving people throughout the region. This purpose and need is supported by five Sound Transit goals and supporting objectives described in Chapter 1, Purpose and Need, of the Final EIS, as follows:

1. Transportation goal: Improve transit mobility in the East Link Corridor.
    a. Improve the quality of transit service.
    b. Increase transit accessibility.
    c. Maximize East Link ridership.
2. Environmental goal: Preserve environmental quality in the corridor.
    a. Minimize potential adverse operating impacts on the natural and built environment.
    b. Minimize potential adverse construction impacts on the natural and built environment.
3. Land use goal: Support regional and local land use goals and objectives.
    a. Support adopted land use and transportation plans.
4. Implementation goal: Minimize risk in the corridor.
    a. Enhance stakeholder and community support.
    b. Design system to reduce construction risk.
5. Financial goal: Provide a financially feasible solution.
    a. Build a system within project budget.
    b. Build a system that can be operated and maintained within available revenue.
    c. Build a system that is cost-effective.

Since these five goals are far more specific than the more general purpose and need statement, and since the Sound Transit goals are entirely consistent with, and amplify upon, the purpose and need, these Sound Transit goals are used in this analysis for a more refined analysis than would be possible if the analysis were to rely solely on the purpose and need statement. The analysis under this factor will specifically address Goals 1, 3, and 4. Sound Transit's Goal 2 is addressed under Factors 1, 2, and 6 in this analysis and Goal 5 is addressed under Factor 7 in this analysis.

D.7.8.1 Sound Transit's Transportation Goal

Sound Transit's transportation goal—to improve transit mobility in the East Link Corridor—is supported by all alternatives evaluated in the Final EIS. The alternatives vary, however, in the degree to which the transportation objectives are fulfilled. Each alternative would fulfill the objective of improving the quality of transit service and each would provide reliable transit service that would not be hindered by congestion through a dedicated right-of-way with stations that provide convenient connections between transit services. In contrast, while all alternatives would generally fulfill the objective of increasing transit accessibility by providing more efficient high capacity linkages, not all alternatives satisfy this objective equally.

Many of the Segment B and C alternatives have similar ridership since they generally connect the same destination with similar travel modes. There are, however, a few alternatives that are significantly less desirable because they carry fewer people and offer less accessibility. The level of accessibility generally corresponds to the ridership for each alternative and both objectives are discussed together. Exhibit D-26 provides a comparative review of ridership generated by each alternative within South Bellevue and Downtown Bellevue.

In South Bellevue, the less desirable alternatives from the transit accessibility and ridership perspective are those that include Alternative B7 (Alternatives *C9T*-B7, *C11A*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7). All of these alternatives require construction of an isolated station at 118th Avenue SE with poor walking, bus, and park-and-ride access. The walking access is poor because of the barriers created by I-405, SE 8th Street, and the Mercer Slough Nature Park. A station at this location would not offer many bus transfer opportunities because it is on a minor arterial with little existing bus service. Diverting routes from Bellevue Way to the station would increase delays for bus passengers and increase operating costs. The park-and-ride is also less convenient since commuters arriving from the east and south on I-90 and I-405 would have to drive further than if using the existing South Bellevue Park-and-Ride.

In Downtown Bellevue, the poorest accessibility and lowest ridership would occur with alternatives that include Alternative C14E (Alternatives C14E-B3 and C14E-B7). The single Downtown Bellevue Station associated with Alternative C14E is located directly adjacent to I-405, and this station is a substantial distance from most Downtown Bellevue destinations. Also, because of its location adjacent to I-405, this alternative is inconvenient for bus transfers because of the long distance from the Bellevue Transit Center. Similarly, the Bellevue Transit Station for Alternatives C7E-B2A, C7E-B2E, C7E-B3, and C7E-B7 is about 800 feet away from the Bellevue Transit Center bus terminal and the concentration of high density Downtown destinations.

Alternatives C1T-B1, C2T-B2A, C2T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C7E-B2E, C8E-B3, and C9A-B2E best meet the project ridership goals. The highest ridership in downtown Bellevue generally occurs with tunnel alternatives that combine grade-separated travel and accessible stations located near the center of downtown and near or directly below the Bellevue Transit Center. The downtown at-grade alternatives, would provide high visibility and direct access to the Bellevue Transit Center, but the slower travel times would result in slightly reduced trips between Seattle and Redmond.

Examining the combined boardings in Segment B-C, the average ridership generated is 12,000 boardings per day. Every alternative combination that includes Alternative B7 generates lower than average ridership (Alternatives *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7) due to the poor accessibility discussed above. Average or better ridership is achieved for all of the other alternatives that are at-grade or tunneled in downtown Bellevue and also serve the South Bellevue Park-and-Ride (Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M, C9T*-B2A, *C9T*-B2E, *C9T*-B3, C1T-B1, C2T-B2A, C2T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C9A-B2A, C9A-B2E, and C9A-B3). Two elevated alternatives in downtown Bellevue achieve higher ridership (Alternatives C7E-B2E, C8E-B3) while five have lower than average ridership (Alternatives C7E-B2A, C7E-B7, C8E-B7, C14E-B3, C14E-B7).

D.7.8.2 Sound Transit's Land Use Goal

The project's land use goal is to implement the project in a manner that supports regional and local land use and transportation plans. As stated in Chapter 1, the Puget Sound Regional Council's (PSRC's) VISION 2040, the regional land use plan, focuses growth in urbanized areas. VISION 2040 rededicates the region's commitment, as stated in VISION 2020, to enable residents to live near jobs and other urban activities, to help strengthen existing communities, and to promote bicycling, walking, and transit use. These focus areas are identified as "urban centers."

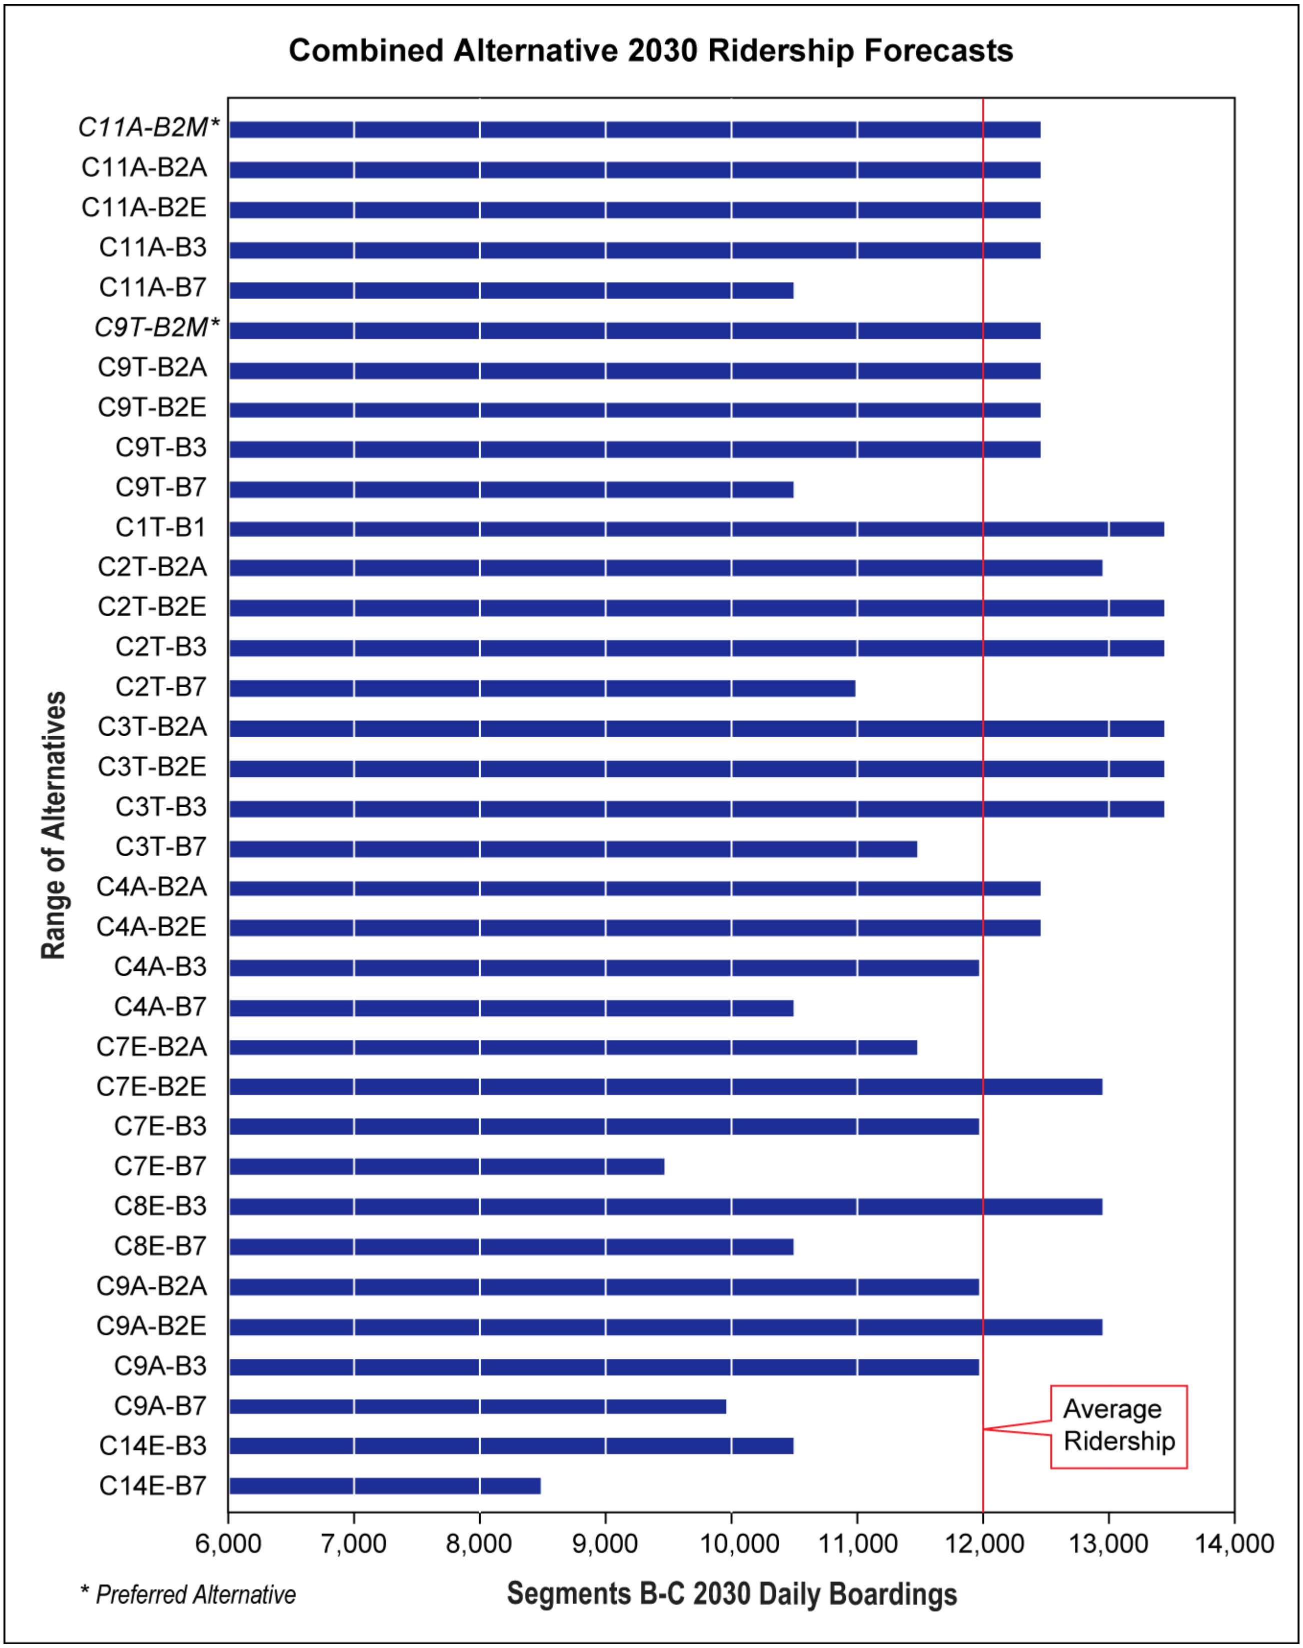

EXHIBIT D-26
Ridership by B-C Alternatives

In response to the state Growth Management Act, PSRC's metropolitan transportation plan, Destination 2030, established policies that prioritize new transportation services in areas that accept an increased share of growth. Because of limited funding, the Regional Transportation Improvement Program strategically focuses funding on developing regional growth centers and the corridors between them. The goal of this prioritization is to concentrate growth in existing urbanized areas and is considered the most efficient way to serve a greater share of the region's population. Out of this vision, the East Link Project was prioritized to provide direct linkages to the transit markets in the urban centers, most specifically the Bellevue Transit Center, the densest portion of downtown Bellevue.

Evaluating the alternatives against this background, the elevated alternatives on the edge of Downtown Bellevue (Alternatives C7E-B2A, C7E-B2E, C7E-B3, C7E-B7, C14E-B3, and C14E-B7), would be less supportive of the project's land use goals than other alternatives. Among those alternatives, Alternatives C14E-B3 and C14E-B7 would be the worst at fulfilling the project's land use goals. Alternative C14E is the most problematic from a land use perspective since it would provide only a single station in Downtown Bellevue, and this station is located on the eastern edge of downtown next to I-405. As a result, many commuters would find the station beyond a typical five to ten minute walking distance. This poor service could constrain the growth of Downtown Bellevue, which is a PSRC-designated Regional Growth Center. Alternatives that rely on Alternative C7E would provide a station one block closer to the Bellevue Transit Center, but still a longer walk to both bus transfers and downtown destinations than other alternatives. It would also provide a second downtown station with the Main Street Station, but its location would be on the very southeast edge of downtown.

The remaining alternatives (Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C11A*-B7, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C1-B1, C2T-B2A, C2T-B2E, C2T-B3, C2T-B7, C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B2A, C8E-B2E, C8E-B3, C8E-B7, C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7) are better at satisfying the project's land use goal. All of these alternatives provide a station directly adjacent to the Bellevue Transit Center, nearest the downtown core and most densely developed area of Downtown Bellevue.

D.7.8.3 Sound Transit's Implementation Goal

The project's implementation goal is to minimize risk in the corridor. Sound Transit developed plans to measure and address the two objectives under this goal by pursuing an ongoing community outreach and involvement plan to enhance stakeholder and community support and designing the East Link Project in a manner that reduces construction risk. The intent of the community support objective is to involve the community in the project development and design process such that the selected alternatives would reduce, or ideally avoid, controversy. The East Link Project has received considerable controversy from the communities in proximity to, and stakeholders with interests in, Segments B and C. None of the alternative combinations have achieved consensus. East Link Project development has continued Sound Transit's commitment to involving the community at every step of the project's 5-year process.

Through NEPA and the State Environmental Policy Act (SEPA) process, Sound Transit has received 1,586 comment letters, which have all been reviewed and responded to in the Final EIS. While the Draft EIS initially reviewed 19 combined alternatives for Segments B and C, as a result of comments and multiple workshops, the number of alternatives has grown to the 35 alternatives reviewed in this analysis. The additional alternatives have also been publicly vetted through an SDEIS. From the comment letters, public meetings, and stakeholder briefings, it is clear that many residents remain concerned about alternatives that are adjacent to their neighborhood. Beginning in September 2006, outreach activities have included hosting public open houses and workshops, offering information at local public meetings, making door-to-door visits, and conducting ongoing agency coordination. In addition, Sound Transit's outreach staff has attended community events, posted regular project updates on the Sound Transit website, and mailed fact sheets and project announcements throughout the project corridor.

To design the project in a manner that reduces construction risk, Sound Transit solicited the involvement of qualified experts to rate the comparative risk factors for the various alternatives. Risks factors include complexity, safety, stakeholder concerns and several other factors. These factors have been consolidated in the project cost estimates presented in Factor 7.

D.7.8.4 Conclusions: Factor 5

Factor 5 only addresses the degree to which the alternatives meet the transportation, land use and risk goals of the project's purpose and need because the environmental impact and cost goals of the purpose and need are reflected in other factors. The transportation goal is addressed through accessibility and ridership, whereas the land use goal assesses how well the project supports land use and transportation plans to serve population and employment centers. Risk has been managed equally for all alternatives, since extensive outreach has addressed and continues to address stakeholder concerns, and construction risk is considered in project cost estimates, which is evaluated in Factor 7. From a combined transportation and land use perspective, the alternatives that include a station directly adjacent to the Bellevue Transit Center and serve the South Bellevue Park-and-Ride, best serve the project purpose and need. Except when connecting from Alternative B7, these are the tunnel and at-grade alternatives as well as Alternative C8E-B3. Although the station is further from the Bellevue Transit Center Alternative C7E-B2E is also included due to its high ridership.

D.7.9 Factor 6: After Reasonable Mitigation, the Magnitude of Any Adverse Impacts to Resources Not Protected by Section 4(f)

D.7.9.1 Analysis of Factor 6

This factor emphasizes unavoidable environmental impacts to resources not protected by Section 4(f) after implementing mitigation measures. The context of this light rail project is that Sound Transit has designed alternatives that follow existing transportation corridors to the extent possible, through extensively developed urban centers with the objective of serving the highest-density transit markets. Given the intensity of adjacent uses, therefore, most of the project impacts can be fully mitigated. There are only relatively minor differences among the quantifiable impacts of the Segment B and C alternatives. The primary unavoidable impacts that cannot be completely mitigated are visual quality, minor vibration impacts, and construction impacts to businesses.

All alternatives along Bellevue Way, except Alternatives *C11A-B2M* and *C9T-B2M*, would lower the visual quality because of widening the Bellevue Way right-of-way to the west and removing mature vegetation. Additionally, Alternative C9A-B2A would lower the visual quality at 112th Avenue SE and Main Street as a result of the permanent straddle bents (the double-column piers that support a beam straddled over the roadway on which sits the guideway) as it turns onto Main Street. Alternatives C8E-B3 and C8E-B7 would result in visual impacts along 110th Avenue NE, to residents and pedestrians. Mitigation measures would reduce the visual impacts for each alternative.

A few vibration impacts might not be avoidable with standard mitigation measures. Alternatives C9A-B2A, C9A-B2E, C9A-B3, and C9A-B7 each would have three locations where project vibration is predicted to exceed FTA criteria. Alternatives C4E-B2A, C4E-B2E, C4E-B3, C4E-B7, C8E-B3, and C8E-B7 each would have two areas, and finally, Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C11A*-B7, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C14E-B3, and C14E-B7 each would have one site where there are potential vibration impacts above the FTA criteria. The affected properties in all instances are hotels and the ability to mitigate these impacts would be reviewed again in final design. During construction, businesses might be adversely affected in Downtown Bellevue along the alignment of all alternatives being considered. Mitigation can reduce the effects, but it would not alleviate disruptions caused by reduced accessibility, noise and visibility.

D.7.9.2 Conclusions: Factor 6

All project alternatives have some unavoidable impacts related to visual quality, minor vibration, and temporary construction on businesses. These impacts would be minimized with project mitigation, and these impacts are not major discriminators that would eliminate any one alternative from consideration.

D.7.10 Factor 7: Substantial Differences in Costs among the Alternatives

D.7.10.1 Analysis of Factor 7

The East Link Project includes the goal of providing a financially feasible solution to transit in the region. This includes the objective of building a system within a project budget that can be operated and maintained within available revenue. This goal is also intended to balance cost with performance as measured by cost effectiveness. Exhibit D-27 compares the cost for each alternative. This bar chart also defines what is fundable under the ST2 Plan revenues with and without the Sound Transit and City of Bellevue term sheet. The ST2 Plan, approved by the voters in November 2008, would fund the construction of the East Link Project. ST2 provides sufficient funding for an at-grade or elevated alternative through Downtown Bellevue (Segment C). However, if the Sound Transit Board selects the most expensive alternative in Segment B (Alternative B7), the only alternatives within the ST2 Plan budget assumptions would be the elevated alternatives on the edge of downtown Bellevue (Alternatives C7E and C14E).

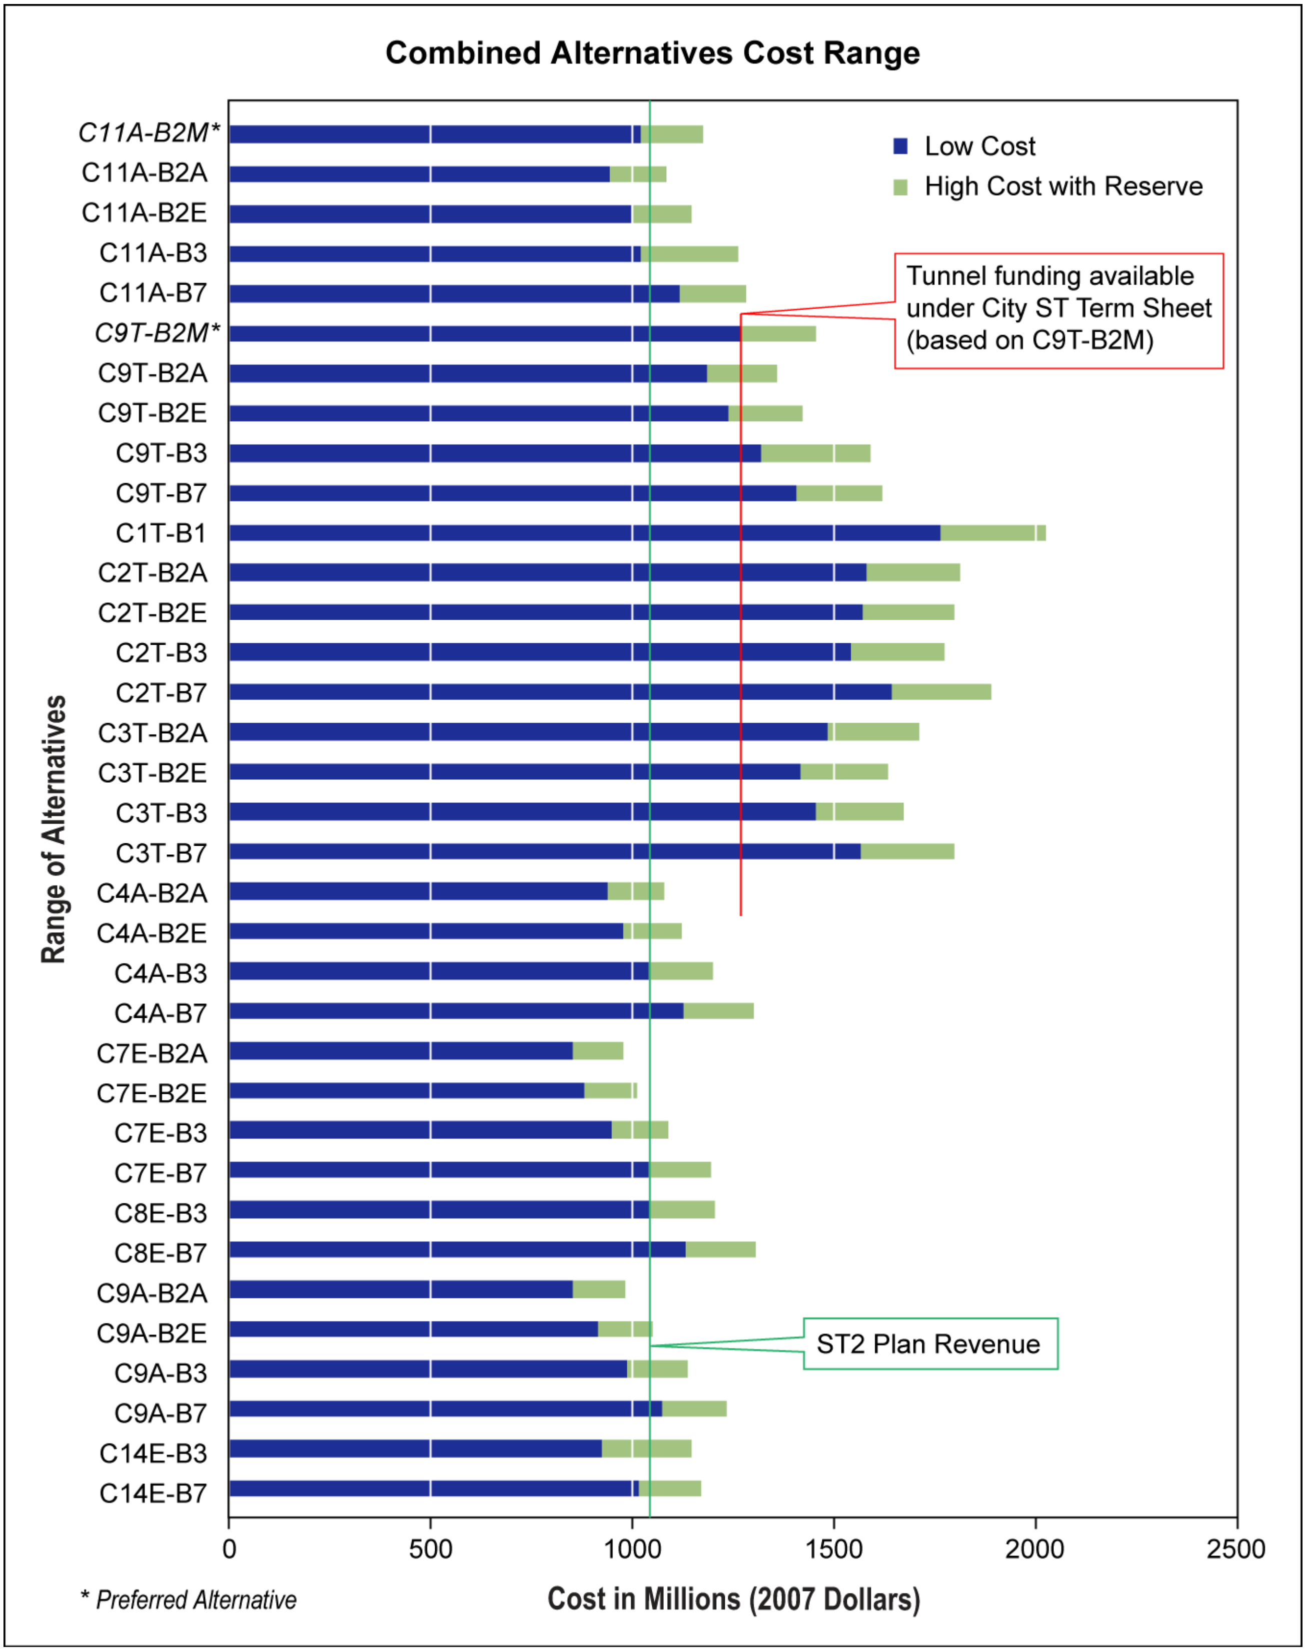

EXHIBIT D-27
Low and High Cost Comparison for Each Alternative

If the Sound Transit Board selects a tunnel alternative in this segment, additional funding sources would be required. The tunnel alternatives (Alternatives *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, *C9T*-B7, C1T-B1, C2T-B2A, C2T-B2E, C2T-B3, C2T-B7, C3T-B2A, C3T-B2E, C3T-B3, and C3T-B7) are not fundable through the existing ST2 funding program. These alternatives are generally estimated to cost an additional $300 to $800 million above the cost of alternatives that rely upon an at-grade or elevated alternative. Three of the tunnel alternatives could, however, be made affordable. *Preferred Alternative C9T*, combined with a 112th Avenue approach into downtown Bellevue (Alternatives *C9T-B2M*, *C9T*-B2A, and *C9T*-B2E), is the lowest cost of the tunnel alternatives and potentially affordable under the term sheet between the City of Bellevue and Sound Transit, if the city provides $150 million in additional funding and accepts the alternative into downtown along 112th Avenue SE.

Another metric that helps to understand the cost difference among alternatives is cost-effectiveness. Cost-effectiveness is measured as the project's annualized cost divided by the projected number of riders that would be attracted each year, for a cost-per-rider estimate. Annualized costs are the project's construction costs averaged over the years of operation. Exhibit D-28 compares the cost effectiveness of each alternative. A lower dollar ($) cost per rider is a more efficient system, carrying more riders for less overall cost.

A cost-effectiveness analysis shows that those alternatives that include Alternative B7 (Alternatives *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7), reduce the cost-effectiveness for the Segment C alternative they connect with in Downtown Bellevue. This is because the costs are higher and the ridership lower than with other Segment B alternatives (e.g., Alternative *C11A*-B7 has poor cost-effectiveness as compared with Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, and *C11A*-B3). Those alternatives that include a tunnel alternative in Downtown Bellevue generally have higher costs per rider than at-grade or elevated alternatives. Tunnels are inherently costlier, and therefore, unless they provide substantially higher ridership, they would have a high cost per rider (ranging between $8.70 to 11.90 per rider).

Preferred Alternative C9T is the lowest cost tunnel alternative when combined with the alternatives that travel along 112th Avenue SE with only slightly lower ridership than the other tunnel alternatives. Alternatives *C9T-B2M*, *C9T*-B2A, and *C9T*-B2E, therefore, are the most cost-effective of the tunnel alternatives. The elevated alternatives have a cost-effectiveness similar to the at-grade alternatives. Similarly, those alternatives with an alternative at-grade in Downtown Bellevue that connect with alternatives from 112th Avenue SE (Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, C4A-B2A, C4A-B2E, C9A-B2A, C9A-B2E, and C9A-B3) have similar to or slightly lower ridership than the tunnel alternatives but at a lower construction cost and, therefore, have a low cost per rider. The elevated alternatives generally have both lower ridership and lower cost and, therefore, similar cost-effectiveness to the at-grade alternatives.

D.7.10.2 Conclusions: Factor 7

Conclusions for Factor 7 rely primarily on differences in project cost, but conclusions are also generally supported with the cost-effectiveness metric. The alternatives that rely upon a tunnel alternative would have a higher cost than at-grade or elevated alternatives through Downtown Bellevue. Of the tunnel alternatives, only *Preferred Alternative C9T* combined with a 112th Avenue SE approach into Downtown Bellevue (Alternatives *C9T-B2M*, *C9T*-B2E, and *C9T*-B2A) would be potentially affordable under the Sound Transit financial criteria with the City of Bellevue term sheet. Alternative B7 through South Bellevue would reduce the cost-effectiveness (Alternatives *C11A*-B7, *C9T*-B7, C2T-B7, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7) for the alternatives that connect within Segment C.

D.7.11 Least Harm Analysis: Conclusions

As required by FTA regulations, this least harm analysis is required to balance and compare seven factors in evaluating which alternative, or alternatives, would have the least harm. As can be seen from the prior discussion, this evaluation and balancing is complex and qualitative in this instance because it requires comparing unlike criteria and weighing the relative importance of each factor and the relative strength or weakness of each *alternative* under each factor. It is, furthermore, important to note that the seven factors are not limited to evaluation of effects on Section 4(f) resources; FTA regulations specifically contemplate that this least harm analysis would balance protection of Section 4(f) resources against other considerations in project planning, including factors such as cost and impacts to nonprotected resources that have little relevance to the protection of Section 4(f) resources.

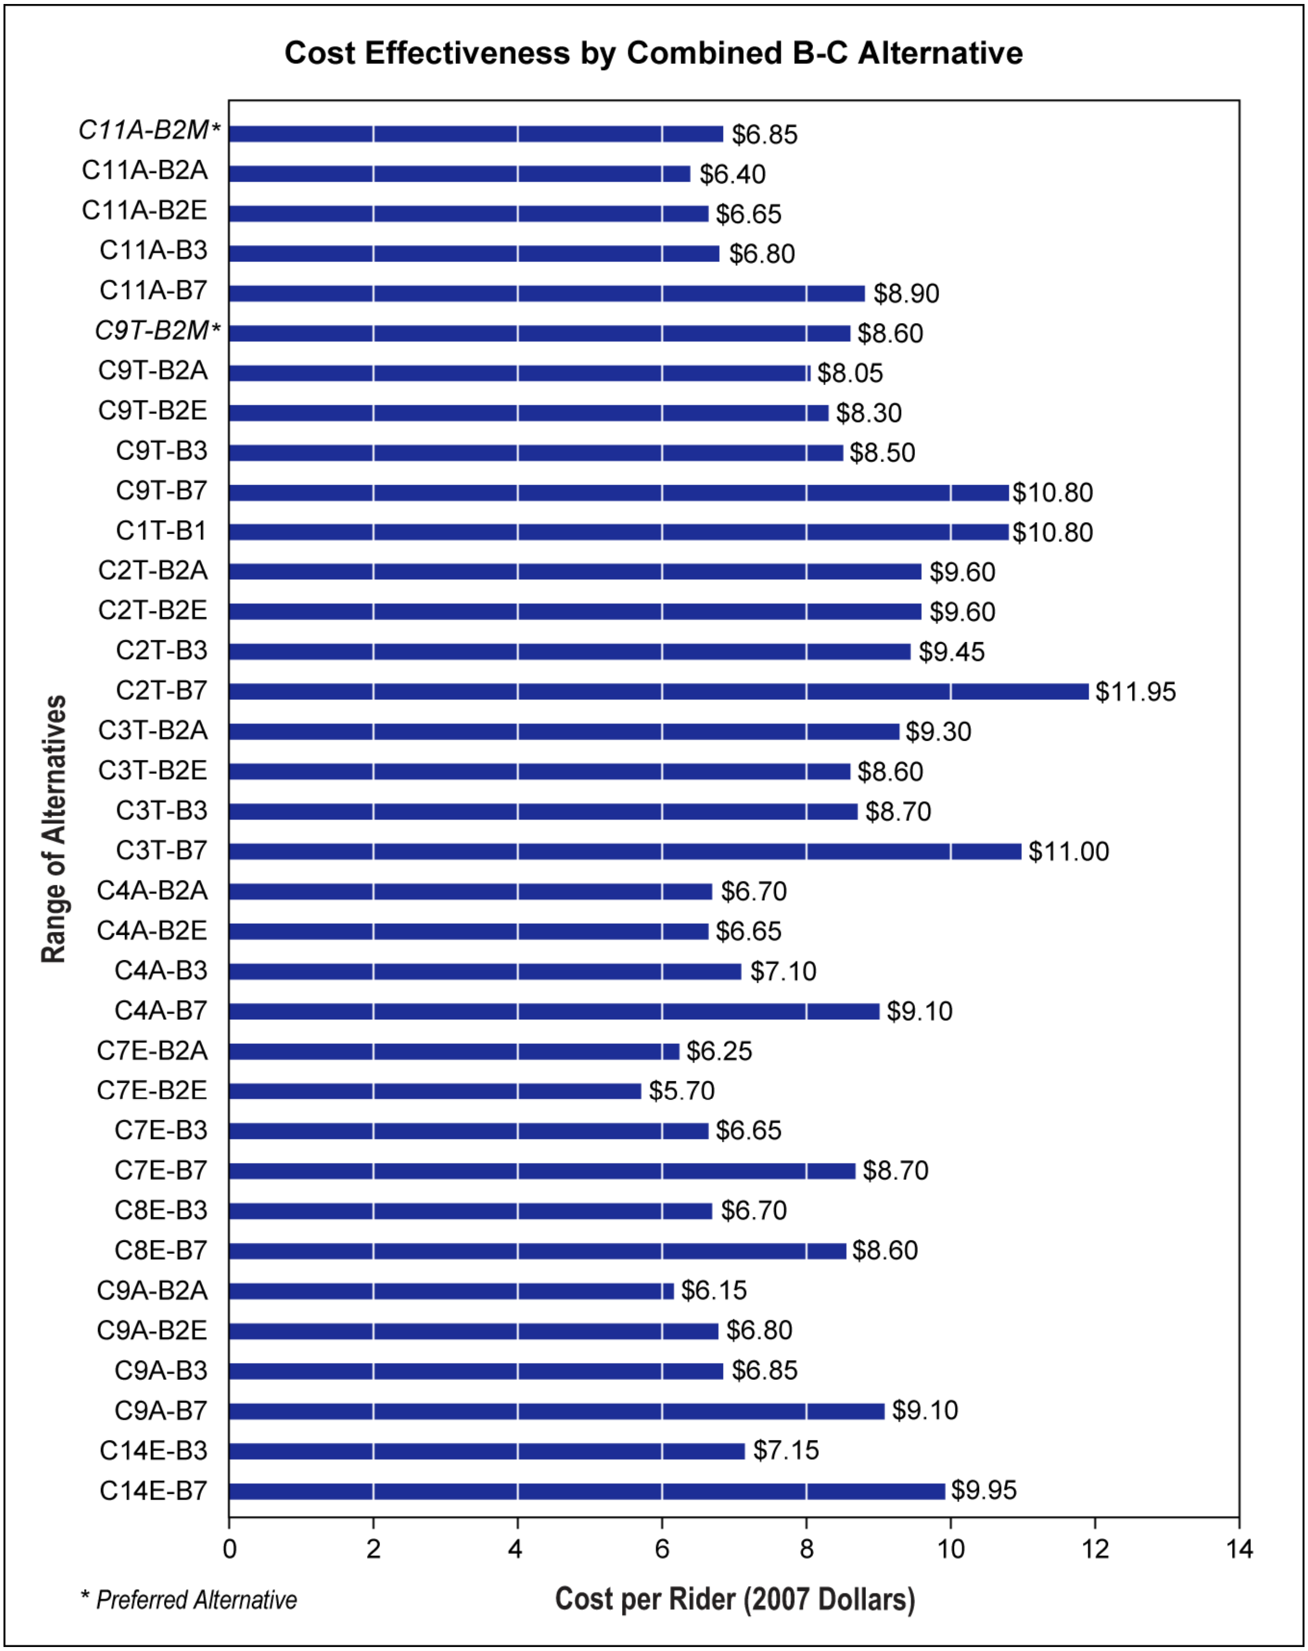

EXHIBIT D-28
Cost Effectiveness for Each Alternative

As a qualitative evaluation, the least harm analysis necessarily requires an element of judgment and evaluation. The previous discussion of each factor was designed to provide the technical and analytical bases for this evaluation. The following discussion summarizes the relative weighing of the 35 alternatives under each of the seven required factors.

D.7.11.1 Factors 1 and 2: The Ability of the Alternative to Mitigate Adverse Impacts to Each Section 4(f) Property (including any measures that result in benefits to the property) and The Relative Severity of the Remaining Harm, after Mitigation, to the Protected Activities, Attributes, or Features that Qualify Each Section 4(f) Property for Protection

With mitigation the following alternatives would result in net impacts on McCormick Park: Alternatives C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B2A, C4A-B2E, C4A-B3, C4A-B7, C8E-B3, and C8E-B7. The visual impact created as a result of the presence of the guideway structure cannot be fully mitigated for McCormick Park. However, there would be a potential for net benefit on Mercer Slough Nature Park from Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, *C9T*-B3, C2T-B2A, C2T-B2E, C2T-B3, C3T-B2A, C3T-B2E, C3T-B3, C4A-B2A, C4A-B2E, C4A-B3, C7E-B2A, C7E-B2E, C7E-B3, C9A-B2A, C9A-B2E, C9A-B3, and C14E-B3. The Winters House would be potentially impacted but with mitigation would have no net adverse impacts and, in fact, would receive net benefits from Alternatives *C11A-B2M* and *C9T-B2M*.

D.7.11.2 Factor 3: The Relative Significance of Each Section 4(f) Property

All parks have been determined to be significant by the City of Bellevue; therefore, it is difficult to solely use the judgment of the City of Bellevue (as the resource manager for all of the Section 4(f) resources) as the basis upon which to distinguish the relative significance of the affected Section 4(f) resources. Mercer Slough Nature Park is a major regional resource, in contrast to Surrey Downs Park and McCormick Park, which are community resources and the NE 2nd Pocket Parks, which are an even more local park resource. This suggests that Mercer Slough Nature Park, as a regional park, is relatively more significant than other park resources. With respect to the Winters House, it is the only historic resource in the City of Bellevue on the NRHP; that makes this resource significant in comparison with the other affected resources.

All alternatives affect Mercer Slough Nature Park, the most significant of the park resources. Some alternatives affect the other, less significant, parks. Only Alternatives *C11A-B2M* and *C9T-B2M* would potentially impact the Winter House, but these are also the only alternatives that offer a benefit to this resource. Other differences between alternatives are minor for this factor.

D.7.11.3 Factor 4: The Views of the Official(s) with Jurisdiction over Each Section 4(f) Property

The City of Bellevue's current preferred alternative is the proposed modifications to C9T-B7 referred to as B7R. In the past, the City has supported alternatives *C9T*-B7 and C2T-B3 with modifications. The alternatives consistent with the term sheet the City signed with Sound Transit are Alternatives *C9T-B2M*, *C9T*-B2A, and *C9T*-B2E. While the City's preferred alternative has changed several times over the last few years, it is clear from the City's extensive input and correspondence that impacts to Section 4(f) resources, while a consideration, have not been the primary determinant in the City's choice of preferred alternative. Instead, the City has prioritized other factors more highly, including the importance of serving the South Bellevue Park-and-Ride market (either at the existing location or relocated south), developing a tunnel alternative through Downtown Bellevue, serving the Wilburton area east of I-405, and minimizing traffic and neighborhood impacts, regardless of the selected alternative. The only Section 4(f) resource that the City has found that would be permanently adversely affected is McCormick Park. As to other Section 4(f) resources, the City has focused on ensuring adequate mitigation rather than necessarily on avoiding impacts. The City has evidently engaged in its own balancing of its broader planning objectives with impact concerns and mitigation to Section 4(f) resources. In this respect, the City's approach appears to be similar to the analytical approach used in this least harm analysis.

DAHP views the Winters House as an important resource for historic preservation. For those alternatives affecting the Winters House (Alternatives *C9T-B2M* and *C11A-B2M*), Sound Transit has incorporated protective measures during construction and mitigation measures that result in net benefits to the Winters House.

D.7.11.4 Factor 5: Degree to Which Each Alternative Meets the Project Purpose and Need

Factor 5 only addresses the degree to which the alternatives meet the transportation, land use and risk goals of the project's purpose and need because the environmental impact and cost goals of the purpose and need are reflected in other factors. The transportation goal is represented by ridership, whereas the land use goal assesses how well the project supports land use and transportation plans to serve population and employment centers. The analysis found that the risk goals did not inform the least harm analysis because construction risk is reflected in the cost estimates and enhancing community support does not differentiate alternatives. Those alternatives with higher ridership and that provide support for land use were generally found to have the least harm for this factor. From a ridership perspective, Alternatives connecting to B7 and to C14E perform poorly compared with the other alternatives. From a combined transportation and land use perspective, the alternatives that include a station directly adjacent to the Bellevue Transit Center and serve the South Bellevue Park-and-Ride best serve the project purpose and need. Except when combined with Alternative B7, these alternatives are the tunnel and at-grade alternatives in Segment C. Although the station is further from the Bellevue Transit Center for Alternative C7E-B2E, this alternative is also included due to its high ridership.

D.7.11.5 Factor 6: After Reasonable Mitigation, the Magnitude of Any Adverse Impacts to Resources Not Protected by Section 4(f)

All project alternatives have some unavoidable impacts related to visual quality, vibration impacts, or construction impacts on nearby businesses. These impacts would be minimized with project mitigation and are not major discriminators in the comparative alternatives evaluation.

D.7.11.6 Factor 7: Substantial Differences in Costs among the Alternatives

Alternatives that can be fully funded are considered to have least harm under Factor 7. Cost-effectiveness (annualized cost per rider) is discussed under Factor 7 to provide additional information about the cost of an alternative.

Most tunnel alternatives (Alternatives C1T-B1, *C9T*-B3, *C9T*-B7, C2T-B2A, C2T-B2E, C2T-B3, C2T-B7, C3T-B2A, C3T-B2E, C3T-B3, and C3T-B7) are not affordable under Sound Transit criteria. And Alternative B7 is only affordable in Alternative C14E-B7 or C7E-B7. *Preferred Alternative C9T* combined with a 112th Avenue SE alternative into Downtown Bellevue (Alternatives *C9T-B2M*, *C9T*-B2E, and *C9T*-B2A) is potentially affordable to Sound Transit pursuant to the terms of a tentative agreement between Sound Transit and the City of Bellevue. Alternatives *C11A*-B7, *C9T*-B3, *C9T*-B7, C1T-B1, C2T-B2A, C2T-B2E, C2T-B3, C2T-B7, C3T-B2A, C3T-B2E, C3T-B3, C3T-B7, C4A-B7, C7E-B7, C8E-B7, C9A-B7, and C14E-B7 have poor cost-effectiveness.

D.7.12 Conclusions

In making the least harm conclusion all seven factors have been considered and weighed, as required by Section 4(f) regulations. This weighing was complex for two reasons. First, there is not a universally accepted best practice for balancing and weighing the factors. Second, the factors are fundamentally unlike: there is no quantitative way, for example, to compare the views of officials with responsibility for 4(f) resources (Factor 4) with the magnitude of impacts on non-4(f) resources (Factor 6).

All seven factors were weighed. In the unique circumstance of the analysis for this project, however, several of the factors were relatively easier to weigh than others and therefore did not require subtle analysis. Almost all the alternatives were identical under Factors 4 and 6 and relatively similar under Factor 3. Therefore, these three factors do not substantially differentiate between the 35 alternatives and do not influence the result of this least harm analysis. It was also relatively simple to compare alternatives under Factor 7 since quantitative data is available on cost effectiveness and on difference in cost. The alternatives can effectively be ranked under Factor 7.

Factors 1 and 2 are largely qualitative and require more subtle and nuanced balancing. In the unique circumstance of this analysis, Factor 1 effectively divides the alternatives into two categories – those whose impacts can be mitigated and those that cannot. Impacts to all Section 4(f) resources can be effectively mitigated except for the impacts to McCormick Park. Therefore, any alternatives that would adversely affect McCormick Park would rank lower on Factor 1 and necessarily lower in the overall least harm analysis. Similarly, Factor 2 also divides the alternatives into those with remaining harm to McCormick Park and those that do not have remaining harm to any of the Section 4(f) resources. Those with remaining harm rank lower in the least harm analysis.

By definition, since all alternatives are considered to be feasible and prudent, they all satisfy the purpose and need for the project. In this case, then, Factor 5, calls for some judgment about the relative degree to which an alternative meets the purpose and need and the relative complexities that an alternative will present. Factor 5 only addresses the degree to which the alternatives meet the transportation, land use and risk goals of the project's purpose and need because the environmental impact and cost goals of the purpose and need are reflected in other factors. The transportation goal is represented by ridership, a quantitative measure, whereas the land use goal is a qualitative assessment of how well the project supports land use and transportation plans to serve population and employment centers. The analysis found that the risk goals did not inform the least harm analysis because construction risk is reflected in the cost estimates and enhancing community support does not differentiate alternatives. Those alternatives with higher ridership and that provide support for land use were found to have the least harm for this factor.

The conclusion from this qualitative and comparative analysis of the least harm Factors is that Alternatives *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, C9A-B2A, C9A-B2E, C9A-B3 and C7E-B2E are equally the alternatives with the least harm. Table D-9 summarizes the results of the analysis. Those alternatives that have the least harm for a particular factor are shaded in green and those alternatives with the least harm overall are shaded in yellow.

TABLE D-9
Summary of Least Harm Factors

Alternative	**Number of Section 4(f) Resources Potentially Affected**	**Section 4(f) Resource Affected**	**Factor 1: Ability to Mitigate**	**Factor 2: Severity of Remaining Harm on Section 4(f) Resources**	**Factor 3: Relative Significance of Section 4(f) Lands**	**Factor 4: Views of Officials[a]**	**Factor 5: Ability to Meet Purpose and Need[b]**	**Factor 6: Magnitude of Impacts on non-Section 4(f) Resources**	**Factor 7: Substantial Difference in Cost**
C11A-B2M	3	Mercer Slough Nature Park, Surrey Downs Park, Winters House	Impacts fully mitigable	Benefits to Winters House and Mercer Slough Nature Park in expanding natural areas	Mercer Slough Nature Park , Winters House most significant	Views of City of Bellevue and DAHP regarding 4(f) resources do not differentiate among the alternatives	Higher than average ridership, supports land use,	Environmental effects o not differentiate among the alternatives	Within ST2 Plan budget
C11A-B2A	2	Mercer Slough Nature Park, Surrey Downs Park	Impacts fully mitigable	Benefit Mercer Slough Nature Park objectives in expanding natural areas	Mercer Slough Nature Park most significant		Higher than average ridership, supports land use		Within ST2 Plan budget
C11A-B2E	1	Mercer Slough Nature Park	Impacts fully mitigable	Benefits Mercer Slough Nature Park objectives in expanding natural areas.	Mercer Slough Nature Park most significant		Higher than average ridership, supports land use support,		Within ST2 Plan budget
C11A-B3	1	Mercer Slough Nature Park	Impacts fully mitigable	Benefits Mercer Slough Nature Park objectives in expanding natural areas.	Mercer Slough Nature Park most significant		Higher than average ridership, supports land use		Within ST2 Plan budget
C11A-B7	1	Mercer Slough Nature Park	Impacts fully mitigable	None	Mercer Slough Nature Park most significant		Lower than average ridership, supports land use		Not within ST2 Plan budget
C9T-B2M	4	Mercer Slough Nature Park, Surrey Downs Park, NE 2nd Pocket Parks, Winters House	Impacts fully mitigable	Benefits to Winters House and Mercer Slough Nature Park in expanding natural areas	Mercer Slough Nature Park , Winters House most significant		Higher than average ridership, supports land use		Within ST2 Plan budget with funding under Bellevue term sheet

C14E-B7	1	Mercer Slough Nature Park	Impacts fully mitigable	None	Mercer Slough Nature Park most significant		Much Lower than average ridership, poor support of land use		Within ST2 Plan budget

Notes: Alternatives that have the least harm for a particular factor are shaded in green, and alternatives with the least harm overall are shaded in yellow.

[a] Whether the City of Bellevue supports an alternative or not does not necessarily reflect their views of Section 4(f) significance.

[b] The transportation, land use and risk elements of the project's purpose and need are reflected in Factor 5, whereas the environmental element is addressed separately under Factors 1,2, and 6 and the cost element is addressed separately under Factor 7.

D.8 Section 6(f) and Washington State Recreation and Conservation Office Resources and Impacts

Section 6(f) lands are those that have been funded for acquisition or improvement through the LWCF grants. The conversion of any portion of these lands follows Title 36 CFR 59.3 of the Land and Water Conservation Fund Program, which instructs the following:

(1) All practical alternatives to the proposed conversion have been evaluated.

(2) The fair market value of the property to be converted has been established and the property proposed for substitution is of at least equal fair market value as established by an approved appraisal (prepared in accordance with uniform Federal appraisal standards) excluding the value of structures or facilities that will not serve a recreation purpose.

(3) The property proposed for replacement is of reasonably equivalent usefulness and location as that being converted. Dependent upon the situation and at the discretion of the Regional Director, the replacement property need not provide identical recreation experiences or be located at the same site, provided it is in a reasonably equivalent location.

The Washington State Recreation and Conservation Office (RCO) administers Section 6(f) of the LWCF Act. The RCO website (http://www.rco.wa.gov/) was accessed on February 13, 2007, and RCO staff was contacted in September and October 2009 to identify Section 6(f) resources in the East Link study area. Project staff also met with NPS and RCO staff on April 12, 2010. Mercer Slough Nature Park has benefited from LWCF monies, which contributed to acquiring multiple parcels to establish the park in 1974 and 1978. Exhibit D-5 shows the area, approximately 130 acres, purchased with these funds. In addition, RCO funds have been used to further acquire portions of the park. King County also received RCO funds for to develop portions of Marymoor Park, but no LWCF grants. Properties funded by RCO are subject to similar requirements for conversion as Section 6(f) without requiring approval from the NPS.

A conversion of recreational use must be approved by RCO and the NPS (for Section 6(f) property) according to the prerequisites listed above. A portion of both the Section 6(f) LWCF- and RCO-funded properties in Mercer Slough Nature Park is jointly owned by Washington State Parks. Table D-10 shows the acreage impacts to Section 6(f), RCO, and Washington State Parks property in Mercer Slough Nature Park for each Segment B alternative.

D.8.1 Section 6(f) Impacts

The LWCF Act requires that before Section 6(f) properties are converted, the agency proposing the conversion must ensure that "all practical alternatives" to converting Section 6(f) properties have been evaluated. As described above, the No Build Alternative would avoid uses of all Section 6(f) resources, however, it does not meet the purpose and need of the East Link Project.

TABLE D-10
Segment B Impacts on Section 6(f) LWCF and RCO Parks and Open Spaces in Mercer Slough Nature Park

	Alternative				
Impact (acres)	***Preferred Alternative C11A-B2M* (acres)**	***Preferred Alternative C9T-B2M* (acres)**	**Alternative C9T-B2A, C11A-B2A, or C9A-B2A (acres)**	**Alternative C9T-B2E, C11A-B2E, or C9A-B2E (acres)**	**Alternative C11A-B3 (high range is due to B3 - 114th Extension Design Option) (acres)**

Impacted area (permanent/construction)	0.3/0.4	0.3/0.4	0.1/0.2	0/0	0.1/0.2 to 0.3
Section 6(f) total a	0.8	0.8	0.3	0/0	0.3 to 0.4
Washington RCO-Funded					
Impacted area (permanent/construction)	0.7/1.0	0.7/1.0	0.6/0.4	0.2/0.3	0.6/0.4
RCO total[a]	1.7	1.7	1.0	0.4	1.0

[a] Includes operational and construction impacts and might not equal the sum of operation and construction impacts shown due to rounding.
[b] Washington State Parks has ownership interest in portions of the Section 6(f) LWCF-funded property and RCO-funded property.

Portions of the park acquired and or developed through LWCF monies do not operate independent of the larger Mercer Slough Nature Park. Therefore, while the specific impact on Section 6(f) alternatives varies by alternative, all Segment B alternatives affect Mercer Slough Nature Park. The avoidance alternative analysis as conducted under the Section 4(f) analysis is applied to these lands as well. Please refer to Section D.6.2 of this document for an avoidance alternatives discussion, which leads to the Least Harm Analysis in Section D.7.

As discussed under the Section 4(f) analysis, the avoidance alternatives in Segment B cannot be separated from Segment C alternatives impacts. Section D.6.1 reviews the range of avoidance alternatives for Mercer Slough Nature Park. This analysis concluded that completely avoiding the park would not be prudent since new routes would result in more extensive impacts on the larger community and adjacent neighborhood relative to the minor impacts that can be fully mitigated to Mercer Slough Nature Park.

Since no prudent and feasible avoidance alternative exists to avoid Mercer Slough Nature Park, a least harm analysis was developed in Section D.7. The least harm analysis results in *C11A-B2M*, *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T-B2M*, *C9T*-B2A, *C9T*-B2E, C9A-B2A, C9A-B3, C9A-B2E and C7E-B2E Alternatives. The LWCF area that would be converted depends uniquely on which alternative is selected.

Impacts are analyzed in light of park objectives for which the LWCF were used. As stated in the *Mercer Slough Open Space Master Plan Environmental Impact Statement* (City of Bellevue, 1990), park objectives` consist of the following:

- Maintain and enhance the extensive wetland wildlife habitat.
- Provide environmental education and awareness and maintain and diversify Bellevue’s agricultural heritage.
- Participate in regional and national efforts to understand wetland ecosystems through research in restoration enhancement techniques.
- Provide passive recreational opportunities in harmony with natural system preservation.
- Maintain and protect important views and open space values.

The alternatives that affect the Section 6(f) resources have permanent impacts ranging from 0.0 to 0.3 acre and temporary impacts ranging from 0.0 to 0.4 acre. However, because the LWCF Act considers using the property for longer than 6 months, which is not considered a temporary use but a full conversion of use, the total impact includes permanent and temporary acquisition. Table D-10 shows the Section 6(f) impacts for the Least Harm alternatives. While only a small portion of the Section 6(f) property would be converted, indirect impacts on the unconverted area must be evaluated along with the direct impacts on the converted area.

The portion of the LWCF Section 6(f) area that would be converted due to direct acquisition is along the roadway intersection of Bellevue Way SE and 112th Avenue SE as illustrated in Exhibit D-4. This area has a steep grade and is difficult to access, with no trails, except for the Mercer Slough Nature Park Periphery Trail+. There is a planned trail in the Section 6(f) property that would remain possible with current East Link designs. The permanent acquisition area would not include wetlands, although a small area of wetland (less than 0.1 acre) would be within the temporary construction area. This wetland area would be considered part of the total conversion area because construction would last longer than 6 months.

The portion of Mercer Slough Nature Park acquired with LWCF serves many of the park objectives, with the exception of the objective regarding Bellevue’s agricultural heritage. Along the edge of the area that would be acquired, park users include walkers and joggers. Most of this use occurs on the east side of the Mercer Slough channel, but some use does occur on the west side of the park, although not within the Section 6(f) property affected by East Link alternatives. Wildlife viewing is an activity in the internal areas of the park. Also, as part of a large nature park that provides open space in an urban area, this Section 6(f) property protects views and open space values. Views from existing trails and planned trails proposed in the City of Bellevue’s *2009 Pedestrian and Bicycle Transportation Plan* (City of Bellevue, 2009) for the Section 6(f) property are largely sheltered due to topography and existing vegetation.

A series of photographs are provided in Attachment D2 that shows views of and from the Section 6(f) property towards the proposed East Link Project to determine whether any viewpoint from the Section 6(f) property would be affected. Attachment D2 also provides a key map of photograph locations. Due to topography and the height of vegetation, the only potential impact would be from planned trails, but this is inconclusive since access could not be achieved under current conditions. Also, funding is not currently available for the planned trail, and therefore, the effect might not occur. The LWCF Section 6(f) area is just south of and borders a portion of the water trail running west to east. Views from this trail toward the project might be possible to varying amounts depending on the alternative constructed, but it is adjacent to the Bellevue Office Park and, therefore, does not represent the Mercer Slough Nature Park objectives.

Much of the 6(f) property provides wetland wildlife habitat and opportunities for research in restoring and enhancing the habitat. Established trails, including the water trail, provide opportunities for education and passive recreation (access beyond trails requires escort by parks staff and is not considered a regular park use). Night use also occurs in the park as part of scheduled programming through City of Bellevue Parks or requires permission from the City.

D.8.1.1 Preferred Alternatives

Preferred Alternative (B2M) portion of the *C11A-B2M* and the *C9T-B2M Preferred Alternatives* would acquire 0.8 acre of Section 6(f) property located east of Bellevue Way and adjacent to the Bellevue Way SE and 112th Avenue NE intersection or less than 1 percent of the total Section 6(f) property. Of this acreage, 0.3 acre would be permanently acquired for the *C11A-B2M* and the *C9T-B2M Preferred Alternatives*, with the remainder used as a temporary construction easement to be restored after project construction. The *C11A-B2M* and the *C9T-B2M Preferred Alternatives* may result in relocating the planned trail's access to Bellevue Way SE in the northwest corner of the park.

People using the water trail along the northern boundary of the Section 6(f) property may have upward views of the catenaries and east face of the retaining wall until the vegetation matures. The vegetation would likely screen parts of the retaining wall and catenaries once mature. In addition, the wall and catenaries would not be out of character with the built elements of the parking and buildings in Bellefield Office Park located north of the Section 6(f) property.

Because the *C11A-B2M* and the *C9T-B2M Preferred Alternatives* would travel in retained cut in the northern half of Bellevue Way SE and portions of 112th Avenue SE, it is unlikely that the train would be seen from any portion of the Section 6(f) property. Similarly, light from the light rail trains is not expected to be visible from the Section 6(f) portions of the park at night due to the guideway's elevation and north-south orientation. The lights might be visible from the water trail where there is a visual opening toward the elevated portion of the alternative and the elevated I-90 ramps, but this view is already affected by vehicle traffic.

As described in Section 4.7, Noise and Vibration, existing noise levels in Mercer Slough Nature Park is bordered on two sides by two interstate highways, I-90 and I-405 and on a third by the major arterial South Bellevue Way, a park-and-ride, and a commercial office park, where "quiet" is not an essential element as outlined in FTA criteria for park noise analysis. The active park uses along the west perimeter include the boat launch, blueberry farm, and Winters House and are not considered noise sensitive. The central portions of Mercer Slough Nature Park contain uses that do meet the criteria as noise-sensitive – such as nature watching and protected trails.

Sound Transit conducted a noise impact analysis for park users in Mercer Slough Nature Park. The typical noise levels at the edge of the park are between 61 decibels (dBA) and 67 dBA, and the internal noise level measured from the middle of the park is 58 dBA. Therefore, for this analysis, the FTA Category 3 land use, which includes certain parks and recreational areas, was used to determine compliance with noise impact FTA criteria. Light rail noise levels from operation of the Preferred Alternatives C11A-B2M and C9T-B2M are predicted to be lower than the existing noise levels by 3 dBa Leq or more at active and noise sensitive locations within the park. Also the project noise levels are well under the FTA noise impact criteria.

Because there would be no substantial impacts that diminish the value or function of the Section 6(f) areas of the park not directly impacted, the conversion area would be limited to the directly converted area consisting of permanent and temporary acquisition.

D.8.1.2 Other Segment B-C Alternatives Affecting Section 6(f) Property

Alternatives *C11A*-B2A, *C11A*-B2E, *C11A*-B3, *C9T*-B2A, *C9T*-B2E, C9A-B2A, and C9A-B2E would all result in similar impacts on the Section 6(f) property as the *C11A-B2M* and the *C9T-B2M Preferred Alternatives* regarding visibility from Section 6(f) property, noise effects, and light. Most of these alternatives would acquire property (refer to Table D-10) as part of widening the intersection at Bellevue Way and 112th Avenue SE to accommodate the light rail guideway. The difference is that the light rail would be in the roadway, and the trees closest to the roadway would be removed, as opposed to leaving trees along the roadway and placing the guideway below the roadway grade in the park. Because the alternatives would not cause indirect impacts that would diminish the value or function of the Section 6(f) areas of the park, the conversion area would be limited to the lands permanently and temporarily affected. Mitigation for any of the least harm alternatives is limited to the property replacement. For Section 6(f) purposes, a replacement property acquired for mitigation must constitute a viable recreational unit. Therefore, if the replacement property is not adjacent to an existing recreational resource, it may need to be developed for recreational use.

D.8.2 Section 6(f) Conversion

Sound Transit has conducted a preliminary review of property adjacent to and having similar market value and function as the Section 6(f) lands. Sound Transit has determined that a number of properties exists that are of equivalent usefulness and location as the lands being converted. These potential properties meet the park objectives to maintain and enhance the extensive wetland wildlife habitat, are located adjacent to Mercer Slough Nature Park, and contain wetland areas.

The NPS prerequisites for conversion approval state that all necessary coordination with other federal agencies must be satisfactorily accomplished. In addition, in cases where the proposed conversion arises from another federal action, final review of the proposal will not occur until the NPS Regional Office is assured that all environmental review requirements related to the project action have been met. This process is under way, in conjunction with FTA through the Final EIS process.

Due to the timing of the project environmental evaluation and the need to demonstrate completion of all other environmental review requirements, Sound Transit will provide the additional environmental evaluation regarding potential replacement property for Section 6(f) conversion consistent with NPS NEPA requirements after the Final EIS is published. FTA can issue its NEPA determination and Record of Decision before the NPS determination. Once the Record of Decision confirms which alternative will be constructed, Sound Transit will coordinate with NPS to complete the 6(f) Section process. NPS evaluation will meet the remaining prerequisites for conversion approval, including establishing the fair market value of the property to be converted and the property proposed for substitution, which will be of at least equal fair market value as established by an approved appraisal. In addition, environmental evaluation of the conversion will analyze the impacts of converting the replacement property. Replacement property will be of similar function and recreation value. Sound Transit will coordinate with the City of Bellevue so that the proposed conversion and substitution are in accord with the State Comprehensive Outdoor Recreation Plan (SCORP).

D.8.3 RCO-Funded Property

Converting properties acquired with RCO funds follows a similar conversion analysis as the Section 6(f) lands, although the RCO oversees this process rather than the NPS. In addition, Washington State Parks has an ownership interest in a portion of the RCO property impacted by the project, requiring consultation with that agency.

D.8.3.1 *Preferred 112th SE Modified Alternative (B2M)*

The *C11A-B2M* and the *C9T-B2M Preferred Alternatives* would acquire 1.7 acres of RCO property along Bellevue Way SE north of the existing South Bellevue Park-and-Ride. Of this total acreage, 0.7 acre would be permanently acquired, with the remainder used as a temporary construction easement to be restored after project construction. While only a small portion of the RCO property would be converted, indirect impacts on the unconverted area must be evaluated in addition to the direct impacts on the converted area.

Buildings, parking, and access associated with the blueberry farm occupy a portion of the RCO area that would be converted due to direct acquisition along Bellevue Way SE. The Heritage Trail crosses the property, running northward parallel to Bellevue Way SE, to connect to the Winters House and to the southeast toward Mercer Slough East; the Mercer Slough Nature Park Periphery Trail, which consists of the sidewalk along Bellevue Way SE, also crosses the edge of the property. A small area of wetland at the south end of the property, just north of the park-and-ride, would be acquired for the project, and the remaining permanent and temporary impact area is wetland buffer.

The portion of the RCO-funded Mercer Slough Nature Park that would be acquired by the project serves the park objective regarding Bellevue’s agricultural heritage because this is the access to the blueberry farm. As described above in the Section 4(f) evaluation, this edge of the park is characterized by active use and access to the blueberry farm and the park’s interior trails. The blueberry farm’s driveway would be relocated and combined with the Winters House driveway. A small area of trail at the north end of the affected property would be relocated slightly to connect with the trail segment to the north that would also be relocated due to the light rail guideway (Exhibit D-4).

The Winters House and the retail activities of the blueberry farm would be closed during construction.

The Eastside Heritage Center would be relocated and the rental use of the Winters House would not occur during construction. Farming operations at the blueberry farm would be maintained during construction, but public access and u-pick would not be permitted. The blueberry farm retail activities would be relocated to enable the business to continue operating during construction. Relocating a small segment of the trail would not substantially affect access to the property or the park, and detours would be provided during construction for temporary closures. Finally, as discussed in Section D.7.1, light rail project operation and construction would not affect the uses in the park's interior because the project would have no noise impacts due to the current ambient noise levels from adjacent roadways and because the at-grade alignment would not have a visual impact.

Converting the RCO area that would be directly impacted by the light rail guideway would not result in indirect impacts on the remainder of the RCO property or the park; therefore, the conversion area would be only that area acquired for project operation and construction. Similar to the Section 6(f) conversion process described above, Sound Transit will provide additional environmental evaluation regarding potential replacement property for RCO conversion as required.

D.8.3.2 Other Segment B Alternatives

All Segment B alternatives, with the exception of Alternative B7, would acquire portions of the RCO-funded property in Mercer Slough Nature Park, but these alternatives would require less acreage than *Preferred Alternative B2M*. Of these alternatives, Alternatives B2A, B3, and B3 - 114th Design Option would acquire the most acreage at 0.9 acre, and Alternatives B1and B2E would acquire the least at 0.4 acre. Impacts would be similar to those discussed for *Preferred Alternative B2M*. However, Alternatives B2A, B2E, B3, and B3 – 114th Design Option are elevated for much of their length along Bellevue Way SE and would be more visible from the park.

D.8.3.3 Preferred Marymoor Alternative (E2)

Marymoor Park was developed with RCO funding (non-Land and Water Conservation Fund monies). *Preferred Alternative E2* would acquire approximately 2.0 acres for project operation and 3.0 acres for construction. Sound Transit would provide replacement land per requirements. The project would not impair RCO-protected park activities, features, or attributes. Similar to the Section 6(f) conversion process described above, FTA and Sound Transit will provide additional environmental evaluation regarding potential replacement property for RCO conversion.

Preferred Alternative E2 would require lowering the profile of the Bear Creek Trail up to 30 feet in length. This trail has received RCO funding. It has also received LWCF grants on segments of the trail which are not impacted by the project. Similarly, East Lake Sammamish Trail has received LWCF grants, but in segments not affected by *Preferred Alternative E2*.

D.8.3.4 Other Segment E Alternatives

The other Segment E alternatives would be elevated over Bear Creek Trail. For the East Lake Sammamish Trail, both alternatives would relocate a portion of the trail. Similar to Bear Creek Trail, this trail has received RCO funding. It has also received 6(f) funding for certain segments of the trail, which are not anticipated to be impacted by the project.

D.9 Record of Coordination

Sound Transit assessed existing conditions at each Section 4(f) property by visiting the sites, consulting with agencies or municipalities with jurisdiction over the 4(f) properties, and reviewing available planning documents and files maintained by relevant municipalities and agencies. Consultation efforts for Section 4(f), Section 6(f), and RCO resources are recorded in Table D-11. Sound Transit and FTA solicited written correspondence from the local officials with jurisdiction in terms of the significance of the resource, the nature and magnitude of the potential impact, and the acceptability of proposed mitigation (copies of these letters where the local agencies of jurisdiction concurred with *de minimis* are provided as Attachment D1). In addition, a series of meetings have been held with the officials with jurisdiction regarding the parks and trails affected by the East Link alternatives. Sound Transit also consulted with NPS and RCO regarding impacts to Section 6(f) and RCO property and acceptable procedures and criteria for converting Section 6(f) and RCO funded park land. Based on the analysis presented, and in cooperation with the local agencies with jurisdiction, FTA has made a determination of *de minimis* for the 4(f) resources under the jurisdiction of the Cities of Seattle, Mercer Island, and Redmond and King County. Sound Transit coordinated with the SHPO to identify properties listed or eligible for listing in the NRHP and consulted with the SHPO regarding potential adverse effects. Section 4.17 of the Final EIS and the *Final EIS Appendix H4 Historic and Archaeological Resources Technical Report* provide additional detail. Letters related to Section 106 referenced in Table D-11 below can be found in *Appendix H4*.

TABLE D-11
Section 4(f) and 6(f) Consultation Summary

Date	Form	Participants	General Topic(s)
August 24, 2006	Letter	FTA/Sound Transit to Tulalip, Duwamish, Muckleshoot, Yakama, Snoqualmie, and Suquamish Tribes; SHPO; ACHP	Opening consultation with tribes

Christopher Williams, Acting Superintendent
City of Seattle, Seattle Parks and Recreation
100 Dexter Avenue
Seattle, WA 98109

Dear Mr. Williams:

As part of the East Link Light Rail Project Final Environmental Impact Statement (EIS) documentation process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities.

The Section 4(f) evaluation is a requirement of the U.S. Department of Transportation Act of 1966. Under the Act, FTA cannot approve a transportation project (such as East Link) that requires the use of any publicly owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that:

- There is no feasible and prudent alternative to using the property; and
- The project includes all possible planning to minimize harm to the property resulting from the use; or
- The use will have no more than a *de minimis* impact on the resource. A *de minimis* impact means a project will have no adverse effect to the activities, features, and attributes of the resource after consideration of any impact avoidance, minimization, and mitigation or enhancement measures.

If the federal lead agency determines that a transportation use of Section 4(f) property, results in a *de minimis* impact on that property, an evaluation of prudent and feasible avoidance alternatives is not required and the Section 4(f) process is complete.

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource to ascertain the position of the officials to obtain their views. The City signed a letter in June 2008 indicating its preliminary concurrence on a *de minimis* determination for city park facilities potentially affected by the project (East Link Draft EIS 2008). Federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource must concur in writing with a *de minimis* finding (23 CFR 774.5 (2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. As per 23 CFR 774.5, the public comment requirement has been met with the distribution of the East Link Draft EIS (2008) and Supplemental Draft EIS (2010) for review and comment by the public, agencies, and groups.

With the comment period on these documents completed, and based on the city's 2008 letter, FTA intends to make a *de minimis* finding on the listed resources that are owned by the City of Seattle and we are requesting the city's final concurrence on this finding. Your letter of concurrence will be included in the Final EIS for East Link. Following the City's written concurrence, FTA will make a final Section 4(f) determination, which will also be included in the Final EIS.

The table below lists Benvenuto Viewpoint as a City of Seattle park facility that the East Link Light Rail Project would impact. Based on Sound Transit's review and your June letter, this park resource is considered significant for purposes of Section 4(f). Given the potential project impacts and the proposed potential mitigation, FTA believes that a *de minimis* finding can be made for Benvenuto Viewpoint. A *de minimis* determination means that after incorporation of mitigation measures, the East Link project will not adversely affect the activities, features, and attributes of the significant park facilities.

City of Seattle Park Facility and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Benvenuto Viewpoint	Significant	Permanent use of up to 0.06 acre (4%) for a station entrance at 23rd Ave S. This area is a landscaped strip that fronts 23rd Ave S	Station entrance designed to be compatible with the City's park design	*de minimis*

We ask that you provide your signature on this letter, or in its place your own letter, to confirm your concurrence on the significance of the Seattle park facility and final agreement with the Section 4(f) *de minimis* determination, and the potential mitigation.

As the project is further refined during final design, Sound Transit will coordinate with the City of Seattle's Department of Parks and Recreation to review and finalize the Rainier Station's entrance design and construction activities. To follow up on this letter, Elma Borbe, Sound Transit Environmental Planner will contact you to provide any information you may need and also to offer a meeting to review this letter.

If you have any questions, please call either John Witmer, Community Planner at (206) 220-7964 or Elma Borbe, Environmental Planner at (206) 398-5445.

Sincerely,

R. F. Krochalis

Re: East Link Light Rail Section 4(f) Determination

Tim –
Dear Mr. ~~Steward~~:

As part of the East Link Light Rail Project Final Environmental Impact Statement (EIS) process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities.

The Section 4(f) evaluation is a requirement of the U.S. Department of Transportation Act of 1966. Under the Act, FTA cannot approve a transportation project (such as East Link) that requires the use of any publicly-owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that:

- There is no feasible and prudent alternative to using the property; and
- The project includes all possible planning to minimize harm to the property resulting from the use; or
- The use will have no more than a *de minimis* impact on the resource. A *de minimis* impact means a project will have no adverse effect to the activities, features, and attributes of the resource after consideration of any impact avoidance, minimization, and mitigation or enhancement measures.

If the federal lead agency determines that a transportation use of Section 4(f) property, results in a *de minimis* impact on that property, an evaluation of prudent and feasible avoidance alternatives is not required and the Section 4(f) process is complete.

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource to ascertain the position of the officials to obtain their views. The City signed a letter in June 2008 indicating its preliminary concurrence on a *de minimis* determination for city park facilities potentially affected by the project (enclosed). Federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource must concur in writing with a *de minimis* finding

(23 CFR 774.5 (2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. As per 23 CFR 774.5, the public comment requirement has been met with the distribution of the East Link Draft EIS (2008) and Supplemental Draft EIS (2010) for review and comment by the public, agencies, and groups.

With the comment period on these documents completed, and based on the city's 2008 letter, FTA intends to make a *de minimis* finding on the listed resources that are owned by the City of Mercer Island and we are requesting the city's final concurrence on this finding. Your letter of concurrence will be included in the Final EIS for East Link. Following the City's written concurrence, FTA will make a final Section 4(f) determination, which will also be included in the Final EIS.

The table below lists the Outdoor Sculpture Gallery as a City of Mercer Island park facility that the East Link Light Rail Project would only impact if Sound Transit included the optional pedestrian bridge over I-90 from Town Center to the Mercer Island Station. Based on Sound Transit's review and your June letter, this park resource is considered significant for purposes of Section 4(f). Given the potential project impacts and the proposed potential mitigation, FTA believes that a *de minimis* finding can be made for the Outdoor Sculpture Gallery. A *de minimis* determination means that after incorporation of mitigation measures, the East Link project will not adversely affect the activities, features, and attributes of the significant park facilities.

City of Mercer Island Park Facility and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Outdoor Sculpture Gallery	Significant	Permanent use of up to 0.2 acres that currently includes a pedestrian path and landscaping. This impact is associated with the pedestrian bridge option only.	Station entrance designed to be compatible with the surrounding design of the park	*de minimis*

We ask that you provide your signature on this letter, or in its place your own letter, to confirm your concurrence on the significance of the Mercer Island park facility and final agreement with the Section 4(f) *de minimis* determination, and the potential mitigation.

As the project is further refined during final design, Sound Transit will coordinate with the City of Mercer Island's Parks and Recreation Department to review and finalize the Mercer Island Station's entrance design and construction activities. To follow up on this letter, Elma Borbe, Sound Transit Environmental Planner will contact you to provide any information you may need and also to offer a meeting to review this letter.

If you have any questions, please call either John Witmer, Community Planner at (206) 220-7964 or Elma Borbe, Environmental Planner at (206) 398-5445.

Sincerely,

R. F. Krochalis

Re: East Link Light Rail Section 4(f) De Minimis Determination

Dear Mr. Larsen:

As part of the East Link Light Rail Project Final Environmental Impact Statement (EIS) documentation process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities.

The Section 4(f) evaluation is a requirement of the U.S. Department of Transportation Act of 1966. Under the Act, FTA cannot approve a transportation project (such as East Link) that requires the use of any publicly owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that:

- There is no feasible and prudent alternative to using the property; and
- The project includes all possible planning to minimize harm to the property resulting from the use; or
- The use will have no more than a *de minimus* impact on the resource. A *de minimus* impact means a project will have no adverse effect to the activities, features, and attributes of the resource after consideration of any impact avoidance, minimization, and mitigation or enhancement measures.

If the federal lead agency determines that a transportation use of Section 4(f) property, results in a *de minimus* impact on that property, an evaluation of prudent and feasible avoidance alternatives is not required and the Section 4(f) process is complete.

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource to ascertain the position of the officials to obtain their views. The City signed a letter in September 2008 indicating its preliminary views on a proposed *de* *minimis* determination for certain city park facilities potentially affected by the project and is included the East Link 2008 Draft EIS. Federal regulations stipulate that "officials with jurisdiction" over the Section 4(f) resource must concur in writing with a *de minimus* finding (23 CFR 774.5 (2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. As per 23 CFR 774.5, the public comment requirement has been met with the distribution of the East Link Draft EIS (2008) and Supplemental Draft EIS (2010) for review and comment by the public, agencies, and groups.

With the comment period on these documents completed, and based on the city's 2008 letter, FTA intends to make a *de minimis* finding on the listed resources that are owned by the City of Redmond and we are requesting the city's final concurrence on this finding. Your letter of concurrence will be included in the Final EIS for East Link. Following the City's written concurrence, FTA will make a final Section 4(f) determination, which will also be included in the Final EIS.

The table below lists Luke McRedmond Park, Bear Creek Trail, and the Redmond Central Connector as City of Redmond park facilities that the East Link Light Rail Project would affect. Alternative E1 would only affect Luke McRedmond Park and all Segment E alternatives would affect the Bear Creek Trail and the Redmond Central Connector. Given the potential project affects and the proposed potential mitigation, FTA believes that a *de minimis impact* finding can be made for Luke McRedmond, Bear Creek Trail and the Redmond Central Connector. A *de minimis* determination means that after incorporation of mitigation measures, the East Link project will not adversely affect the activities, features, and attributes of the significant park facilities.

City of Redmond Park Facility and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Luke McRedmond (E1)	Significant	Permanent use of up to 0.1 acre under elevated structure.	One or more of the following measures would be implemented: Financial compensation for permanent aerial easement, or improvements to the park as agreed to with the City. Replacement of trees removed per City tree ordinance.	*de minimus*
		Temporary use of land during construction	*Financial compensation for the lease of land during construction, as agreed to with the City.* *Maintain access to the park*	

City of Redmond Park Facility and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
			during construction. *Restore temporarily disturbed area to existing conditions.*	
Bear Creek Trail (***Preferred Alternative E2*** and alternatives E1, E4)	Significant	Permanent tunneling of trail for up to 30 feet (E2). Permanent shading from elevated structures (E1, E4)	The following measures would be implemented for the impacts described: Rerouting of trail, restoration of vegetation, and replacement of trees (E2); Financial compensation for permanent aerial easement, or improvements to the trail as agreed with the City (E1, E4).	*de minimus*
		Temporary loss of use of trail during construction	*Financial compensation for the lease of land during construction, as agreed with the City.* *Maintain access or provide detours for trail during construction.* *Restore temporarily disturbed area to existing conditions.*	
Redmond Central Connector (Trail/Park Corridor) (***Preferred Alternative E2***, and alternatives E1, E4)	Significant	Possible reduction of planned trail width, removal of planned park amenities and associated vegetation (E2, E1, E4)	The following measures would be implemented for the impacts described: Possible rerouting of trail, replacement of affected park amenities, and associated vegetation as agreed to with the City.	*de minimus*
		Temporary loss of use of planned trail and park facilities during construction	*Financial compensation for the lease of land during construction as agreed to with the City.* *Maintain access or provide detours for trail during construction.* *Restore temporarily disturbed area to existing conditions.*	

In addition, the impact to the Redmond Central Connector is assumed *de minimus*, because Sound Transit will be contributing toward the purchase of the Woodinville Subdivision (former BNSF Rail Corridor) to obtain real property and easements for the right to operate a light rail on the remainder of the corridor from the Port of Seattle and the City of Redmond to operate light rail. This contribution toward the purchase of the corridor, and subsequent easements, will guarantee Sound Transit access to the downtown Redmond segment of the former BNSF corridor without having to replace the land at the time of project implementation as part of 4(f) requirements.

We ask that you provide your signature on this letter, or in its place your own letter, to confirm your concurrence on the significance of the City of Redmond park facility and final agreement with the Section 4(f) *de minimus* determination, and the potential mitigation. We are requesting a response within 30-days of the date of this letter.

As the project is further refined during final design, Sound Transit will coordinate with the City of Redmond's Parks and Recreation Department to review and finalize the City of Redmond design and construction activities. To follow up on this letter, Elma Borbe, Sound Transit Environmental Planner will contact you to provide any information you may need and also to offer a meeting to review this letter. If you have any questions, please call either John Witmer, Community Planner at (206) 220-7964 or Elma Borbe, Environmental Planner at (206) 398-5445.

Sincerely,

R. F. Krochalis

201 South Jackson Street
Seattle, WA 98104-3855

Dear Mr. Brown:

As part of the East Link Light Rail Project Final Environmental Impact Statement (EIS) documentation process, the Federal Transit Administration (FTA), as the lead federal agency, is finalizing the Section 4(f) evaluation of the potential impacts of the project on public parks and recreational facilities. On behalf of FTA, Sound Transit has been coordinating with King County to review and reach an agreement for a de minimis finding regarding potential impacts and mitigation measures to the Sammamish River Trail ("River Trail"), East Lake Sammamish Trail ("Lake Trail"), and Marymoor Park ("the Park") that are located along the alternatives in Segment E of the project. For each of these park resources, the results of this consultation and agreements are described in this letter.

BACKGROUND

The Section 4(f) evaluation is a requirement of the U.S. Department of Transportation Act of 1966. Under the Act, FTA cannot approve a transportation project (such as East Link) that requires the use of any publicly owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that:

- There is no feasible and prudent alternative to using the property; and
- The project includes all possible planning to minimize harm to the property resulting from the use; or
- The use will have no more than a *de minimis* impact on the resource. A *de minimis* impact means a project will have no adverse effect to the activities, features, and attributes of the resource after consideration of any impact avoidance, minimization, and mitigation or enhancement measures.

APR 27 2011 AM10:36

If the federal lead agency determines that a transportation use of Section 4(f) property, results in a *de minimis* impact on that property, an evaluation of prudent and feasible avoidance alternatives is not required and the Section 4(f) process is complete.

Federal guidance encourages early coordination with officials with jurisdiction over the Section 4(f) resource to ascertain the position of the officials to obtain their views. The County signed a letter in September 2008 indicating its preliminary concurrence on a *de minimis* determination for county park facilities potentially affected by the project. Federal regulations stipulate that officials with jurisdiction over the Section 4(f) resource must concur in writing with a *de minimis* finding (23 CFR 774.5 (2)). The regulations also require that an opportunity for public review and comment concerning the effects of the project on the Section 4(f) resource be provided prior to such written concurrence. As per 23 CFR 774.5, the public comment requirement has been met with the distribution of the East Link Draft EIS (2008) and Supplemental Draft EIS (2010) for review by the public, agencies, and groups.

The following table lists the King County park facilities that the East Link Light Rail Project would impact, the alternatives affecting the resource, the potential impacts, mitigation measures and Section 4(f) finding after mitigation. Additional information for each of the park facilities is also discussed below.

King County Park Facilities and Summary of Section 4(f) Use

Name of Resource and Alternatives	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Sammamish River Trail Alternatives E1, E2 and E4	Significant	Permanent shading of about 20 to 30 feet of trail	Acquire replacement recreation land equal in value to offset the light rail use within the trail right of way per RCO requirements	*de minimis*
		Possible impacts to trail use if guide way columns are located within trail right-of-way	Locate guideway columns outside trail clear zone as practical.	
		Possible temporary use of land outside of the	*Financial compensation for temporary use of land outside of the light rail right-of-way for*	

King County Park Facilities and Summary of Section 4(f) Use

Name of Resource and Alternatives	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
		light rail right-of-way for construction	*construction*	
		Possible detour of trail during construction	*Rerouting and restoration of trail to King County standards and specifications during and after construction.*	
East Lake Sammamish Trail	Significant	Permanent relocation of about 900 feet of trail	Financial compensation for the light rail use of the trail right-of-way	*de minimis*
Alternatives E1, E2 & E4		*Possible temporary use of land outside of the light rail right-of-way for construction*	*Financial compensation for temporary use of land outside of the light rail right-of-way for construction*	
		Detour of trail during construction	*Rerouting and restoration of trail to King County standards and specifications during and after construction.*	

Marymoor Park Alternative E2	Significant	Permanent use of about 2.0 acres	Acquire replacement recreation land equal in value and function to offset the light rail use within the Park property.	*de minimis*
		Temporary use of about 3.2 acres during construction	*Financial compensation for the temporary use of land outside the light rail right-of-way for construction.*	
		Temporary impacts to park use during construction	*Park land restoration following construction*	

Sammamish River Trail

There is no direct trail use by the project associated with the Sammamish River Trail and all Segment E alternatives would span the trail resulting in an additional 20 feet of trail shading. Through continued coordination with the County, two issues were raised regarding the project's potential impacts to the River Trail. The County requested that, to the extent practical, locating project columns should be avoided in the "clear zone" (up to 8 feet) on either side of the trail. However, if locating the project columns or improvements within the clear zone is unavoidable, the County requested that Sound Transit hold harmless and indemnify King County from any property damage or personal injury related to guide way columns. Sound Transit and County staff discussed this subject and agree that Sound Transit would locate the guideway columns outside of the trail clear zone to the extent practical. In addition, as part of a future property agreement between the agencies, issues regarding indemnification would be addressed, if needed.

East Lake Sammamish Trail

The East Lake Sammamish Trail would require realignment and relocation to accommodate the light rail project. There is adequate width within the former BNSF Railway corridor to accommodate both facilities. Access to the trail and connections to the Bear Creek Trail would not be impacted by the project.

Through continued coordination with the County, it was requested that Sound Transit acknowledge that East Lake Sammamish Trail is a "rail bank corridor." Rail banking, as defined by the National Trails System Act, 16 USC 1247(d) is a voluntary agreement between railroad company and a trail agency to use out of service rail corridors for trail purposes until such time as a bonafide railroad use requires the corridor again for rail service. Sound Transit and County staff discussed this subject and agree that as part of future work, the appropriate covenants would be put in place to comply with the federal rail banking regulations.

Marymoor Park

For Marymoor Park the light rail would require permanent and temporary use of the park on the northern edge and no recreation facilities would be directly affected by operation; however, an unofficial equestrian route would be affected. In addition, a wetland mitigation site is located along the north edge of the park. In 2010, a "deed restriction" document on the site was prepared by King County. At such time as the design of the East Link Project is advanced in the future, Sound Transit would coordinate with the appropriate agencies to address and mitigate impacts, in compliance with provisions established in the deed restriction.

Through continued coordination with Sound Transit, the County raised issues associated with potential light rail noise impacts on park uses. From west to east, the portion of the park closest to SR 520 currently includes the following facilities: three baseball diamonds, four tennis courts, two multisport fields, a reflexology path, three soccer fields, a wetland area, a cricket pitch, a recreation and event area, a bicycling velodrome, and a climbing rock. Sound Transit and County staff further discussed these issues and agree that when the light rail design is advanced during Preliminary Engineering, Sound Transit would, in coordination with the County, evaluate noise impacts to park uses in place at that time consistent with FTA noise analysis methods and criteria.

CONCLUSION

Given the potential project impacts, proposed mitigation, and continued consultation with King County, FTA believes that a *de minimis* finding can be made for the Sammamish River Trail, the East Link Sammamish Trail and Marymoor Park. A *de minimis* determination means that after incorporation of mitigation measures, the East Link project will not adversely affect the activities, features, and attributes of the significant park facilities.

FTA and Sound Transit acknowledge that this Section 4(f) concurrency letter is based on current environmental analysis and project information. Given that the design for Segment E is at the conceptual engineering phase (about 5 percent), Sound Transit will continue coordinating with King County when the project design is advanced during preliminary engineering and final design .

We ask that you provide your signature on this letter, or in its place your own letter, to confirm your concurrence on the significance of the King County park facilities and final agreement with the Section 4(f) *de minimis* determination, and the potential mitigation. Following the County's written concurrence, FTA will make a final Section 4(f) determination, which will also be included in the Final EIS.

If you have any questions, please call either John Witmer, FTA Community Planner at (206) 220-7964 or Elma Borbe, Sound Transit Environmental Planner at (206) 398-5445.

Sincerely,

Linda M. Gehrke

Re: East Link Light Rail Project Section 4(f) Determination

Craig Larsen, Director
City of Redmond Parks and Recreation
15670 NE 85th Street
Redmond, WA 98052-3580

Dear Mr. Larsen:

Thank you for your letter dated March 9, 2011 with regards to concurring with the Federal Transit Administration's (FTA) intent to make a finding of *de minimis* pursuant to 23 CFR 774.5 (2) for Luke McRedmond Park, Bear Creek Trail, and the Redmond Central Connector that are located within the City of Redmond.

Please accept this letter as an addendum to the March 9 letter. Another Redmond park facility for which FTA intends to make a *de minimis* finding is for the Edge Skate Park. FTA requests the City's final concurrence on this finding. With your signature below, this addendum letter of concurrence will be included in the East Link Final Environmental Impact Statement (EIS). Following the City's written concurrence, FTA will make a final Section 4(f) determination, which will also be included in the Final EIS.

The table below lists Edge Skate park facility that the East Link Light Rail Project would impact. Alternative E2 Transit Center Design Option is the only alternative that would potentially impact this park. Given the potential project impacts and the proposed potential mitigation, FTA believes that a *de minimis* finding can be made for Edge Skate Park. A *de minimis* determination means that after incorporation of mitigation measures, the East Link project will not adversely affect the activities, features, and attributes of the significant park facilities.

MAY 27 2011

City of Redmond Park Facility and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Edge Skate Park (E2 Transit Center Design Option)	Significant	Permanent use of less than 0.1 acre.	Financial compensation as agreed with the City; or *Financial compensation for the use of land as agreed with the City during construction*	*de minimis*
		Temporary use of land during construction	*Restore temporarily disturbed area to existing conditions*	
		Temporary indirect impacts include noise and visual effects.	*Maintain access to skatepark.*	

We ask that you provide your signature on this letter or, in its place, your own letter to confirm your concurrence on the significance of the City of Redmond park facility, the final agreement with the Section 4(f) *de minimis* determination, and the potential mitigation. As the project is further refined during final design, Sound Transit will coordinate with the City of Redmond's Parks and Recreation Division to review and finalize the design and construction activities. If you have any questions, please call either John Witmer, Community Planner at (206) 220-7964 or Elma Borbe, Environmental Planner at (206) 398-5445.

Sincerely,

Kenneth A Feldman

Elma Borbe, Environmental Planner
East Link Light Rail
Sound Transit
402 S. Jackson Street
Seattle, WA 98104-2826

Dear Ms. Borbe:

As you know, the Federal Transit Administration (FTA) is the lead federal agency on the Final Environmental Impact Statement (EIS) for Sound Transit's East Link Light Rail Project ("the Project") and is finalizing the Section 4(f) evaluation of the project's potential impacts on public parks and recreational facilities, as required by the U.S. Department of Transportation Act of 1966.

The King County Parks and Recreation Division ("Division") owns and operates several park and recreation facilities along the proposed route of the East Link project, including the Sammamish River Trail ("River Trail"), East Lake Sammamish Trail ("Lake Trail"), and Marymoor Park ("the Park"). We understand that the FTA intends to make a *de minimis* finding regarding East Link's impacts on those park and recreation facilities. The FTA asked the Division to concur in that finding on behalf of King County. The Division understood Sound Transit to make this request as part of the coordination and consultation process required under Section 4(f) of the Department of Transportation Act of 1966 (as amended), and its implementing regulations, codified at Title 23 of the Code of Federal Regulations (CFR) Part 774 (together, "the Act").

We thank you for your prior correspondence and documentation regarding this matter. As anticipated in the Divisions' 2008 letter concurring in Sound Transit's preliminary *de minimis* conclusion, and consistent with 23 CFR 774.5(b)(2)(i)-(ii), King County has now separately evaluated whether to concur in Sound Transit's conclusion that the Project will have *de minimis* impacts on King County park resources. I regret that King County cannot completely concur in the FTA's determination at this point in time.

To be clear, **we conditionally concur in FTA's *de minimis* finding regarding East Link's impacts on the River Trail**, so long as the proposed mitigation is properly and fully implemented, and so long as Sound Transit avoids placing Project-related improvements in the "clear space" around the River Trail; or, alternatively, Sound Transit covenants to hold harmless and indemnify King County from any property damage or personal injury arising out of, caused by, or related to guideway columns permanently located in that "clear space." Also, **we conditionally concur in FTA's *de minimis* finding regarding East Link's impacts on the Lake Trail**, so long as Sound Transit provides replacement property for any Lake Trail corridor property occupied by the East Link Project, and so long as Sound Transit covenants to comply with all applicable "railbanking" requirements, including but not limited to those set forth in 16 U.S.C. §1247(d) and 49 C.F.R. §1152.29. However, at the present **time King County does not concur in FTA's *de minimis* finding regarding East Link's noise and vibration impacts to the Park**. As explained below, we believe that additional review and analysis is required to properly assess and mitigate these impacts.

BACKGROUND

Under Section 4(f) of the U.S. Department of Transportation Act of 1966, FTA cannot approve a transportation project (such as East Link) that requires the use of any publicly owned land from a significant public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site, unless a determination is made that (underlining, bolding added):

- There is no feasible and prudent alternative to using the property; and
- The project includes all possible planning to minimize harm to the property resulting from the use; or
- The use will have no more than a *de minimis* impact on the resource. A *de minimis* impact means a project will have **no adverse effect to the activities, features, and attributes of the resource after consideration of any impact avoidance, minimization, and mitigation or enhancement measures**.

If the federal lead agency determines that a transportation use of Section 4(f) property results in a *de minimis* impact on that property, an evaluation of prudent and feasible avoidance alternatives is not required and the Section 4(f) process is complete. However, federal regulations stipulate that "officials with jurisdiction over the Section 4(f) resource **must concur** in writing with a *de minimis* finding (23 CFR 774.5 (2)) (underlining, bolding added).

It is our understanding that the FTA analyzed the potential project impacts and the proposed potential mitigation described above, and concluded that a 4(f) *de minimis* finding could be made for the River Trail, the Lake Trail, and the Park. As recited above, a *de minimis* determination would mean that after incorporation of mitigation measures, the Project will not adversely affect the activities, features, and attributes of these significant park and recreation assets. For the reasons set forth below, King County conditionally concurs in FTA's *de minimis* findings regarding the River Trail and the Lake Trail; but King County rejects FTA's *de minimis* finding regarding the Project's noise and vibration impacts to the Marymoor Park.

DISCUSSION OF IMPACTS

The FTA identified the River Trail, the Lake Trail, and the Park as King County park facilities that would be impacted by the East Link Light Rail Project ("the Project"). We address each of them in turn.

SAMMAMISH RIVER TRAIL

In a draft letter sent earlier this year, the FTA summarized the Project's impacts to the River Trail as follows:

King County Park Facilities and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Sammamish River Trail/E1 & E2	Significant	Permanent shading of about 20 to 30 feet of trail Possible impacts to trail use if guide way columns are located within trail right-of-way	Acquire replacement recreation land equal in value to offset the light rail use within the trail right of way per RCO requirements	*de minimis*
		Possible detour of trail during construction	*Financial compensation for temporary use of land outside of the light rail right-of-way needed for construction* *Rerouting and restoration of trail and disturbed areas to King County standards and specifications during and after construction.*	

The FTA's letter also stated that "[t]here is no direct trail use by the [P]roject associated with the . . . River Trail and all Segment E alternatives would span the trail resulting in an additional 20 feet of trail shading."

We agree that the River Trail is a significant resource. We agree that the Project will result in additional shading of 20 to 30 feet of the Trail. And we agree that the Project's shading and temporary displacement/detour impacts on the River Trail can be mitigated by detouring the trail during construction, compensating King County for temporary use of County property, and restoring the River Trail and disturbed areas to County standards and specification after construction.

We appreciate that the FTA and Sound Transit recognize the need to compensate King County for Project use of the River Trail right of way, particularly for guide way supports that may be located there. And we agree that those impacts must be mitigated through the acquisition of replacement property. However, we think the FTA's letter overlooked some additional, critical impacts and potential mitigation regarding those guide way supports.

Nationally-recognized standards and guidelines govern the design of multipurpose trails like the River Trail. These standards and guidelines include, but are not limited to the Washington State Department of Transportation Manual M 22-01 Ch. 1515 ("WSDOT Manual"), and the Guide for Development of New Bicycle Facilities, published by the American Association of State Highway and Transportation Officials ("AASHTO Guide"). The AASHTO Guide is the standard for the construction and design of federally-funded bicycle routes, 23 C.F.R. 652.13(a) (2006). Under the AASHTO Guide, the WSDOT Manual, and other standards, a multipurpose trail like the River Trail should have a *clear zone* of 2 to 5 feet (and up to 8 feet) on either side of the paved trail surface. The purpose of this clear zone is to ensure that cyclists, rollerbladers, or runners do not accidentally clip or run into a trailside obstacle or obstruction, and to provide a modicum of runoff room if a trail user needs to make an emergency maneuver to avoid a collision, or to get out of the way.

Assuming that a "guide way support" is something like a concrete column or abutment, or a steel girder, these structures do not belong in the paved trail surface or the clear zone. To do so would be contrary to nationally-recognized guidelines, safety practices, and common sense. Therefore, **the FTA should impose an additional mitigation measure requiring that to the maximum extent practicable, Sound Transit should design the Project to avoid placing guide way supports in the clear zone on either side of the River Trail.**

If it proves impossible for Sound Transit to engineer the Project to avoid placing improvements in the River Trail clear zone, then the **FTA should impose an additional mitigation measure requiring Sound Transit to execute a covenant to hold harmless, indemnify, and defend King County from any and all claims or litigation regarding property damage, personal injury, or death that may be caused by, arise out of, or relate to Project improvements located in the clear zone.** King County hereby notifies the FTA and Sound Transit that King County will require Sound Transit to execute such a covenant in connection with any agreement to allow Project-related improvements in the River Trail right of way. King County will also require Sound Transit to sign or mark any Project improvements in the clear zone in order to visibly identify them as hazards.

Subject to these additional conditions and mitigation measures, as well as those previously identified by the FTA, and so long as the proposed mitigation is properly and fully implemented, King County conditionally concurs in FTA's *de minimis* finding regarding the Project's impacts on the River Trail.

EAST LAKE SAMMAMISH TRAIL

In its draft letter sent earlier this year, the FTA summarized the Project's impacts to the Lake Trail as follows:

King County Park Facilities and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
East Lake Sammamish Trail/E1, E2, & E4	Significant	Permanent relocation of about 900 feet of trail	Financial compensation for the light rail use of the trail right-of-way	*de minimis*
		Detour of trail during construction	*Financial compensation for temporary use of land outside of the light rail right-of-way needed for construction*	
			Rerouting and restoration of trail and disturbed areas to King County standards and specifications during and after construction.	

FTA's draft letter further stated that "The [Lake Trail] would require realignment and relocation, but there is adequate width within the former BNSF Railway corridor to accommodate both facilities and access to the trail and connections to the Bear Creek Trail would not be impacted by [P]roject operation . . . [T]his park resource is considered significant for purposes of Section 4(f)."

We agree that the Lake Trail is a significant resource. We agree that the Project will displace a segment of the Lake Trail. And we agree that the Project's temporary and permanent displacement of the Lake Trail can be mitigated by detouring the trail during construction, compensating King County for temporary and permanent use of County property, and relocating and restoring the Lake Trail and disturbed areas to County standards and specification after construction. We appreciate that the FTA and Sound Transit recognize the need to compensate King County for Project use of the Lake Trail right of way. However, we think the FTA's letter overlooked some additional, critical impacts and potential mitigation regarding Project impacts to the Lake Trail.

The Lake Trail occupies a former freight rail corridor that is "railbanked" or preserved for the future restoration of freight service under the National Trails System Act 16 U.S.C. 1247(d).[1] Such corridors may be used for trail purposes on an interim basis. However, trail use is subject always to the possibility that the corridor could be reclaimed for freight rail service. Federal regulations are quite specific that "interim trail use is . . . subject to possible future reconstruction and reactivation of the right-of-way for rail service." 49 C.F.R. §1152.29(a)(3).

King County is the "interim trail user" ("Trail User") responsible to maintain and protect the railbanked corridor in which the Lake Trail is located, 49 C.F.R. §1152.29(a). As the Trail User, King County is legally obligated to ensure that sufficient real property interest remains in a railbanked corridor to allow the restoration of freight rail service. See Central Kansas Railway, LLC -- Abandonment Exemption -- In Marion and McPherson Counties, KS, Docket No. AB-406 (Sub-docket No. 6X) (Service Date December 18, 1998) (1998 WL 884726) at *4. One example of a corridor use likely inconsistent with restoration of freight service would be a full-width disposition of all property interests that permanently "severs" the railbanked corridor from tracks that remain in use for interstate freight, and forever "strands" the railbanked corridor away from interstate commerce. See Burlington Northern Railroad Co. -- Abandonment Exemption -- In Klickitat County, WA, Docket No. AB-6 (Sub-No. 346X) (June 8, 2005) (2005 WL 1350596) (litigation challenging "railbanked" status of a corridor where railroad allegedly conveyed a full-width section of the corridor that would sever railbanked track from interstate commerce).

---

[1] The FTA's draft 2011 letter acknowledged the Lake Trail's status as a railbanked corridor. It stated that:

> [r]ailbanking . . . is a voluntary agreement between a railroad company and a trail agency to use an out-of-service rail corridor as a trail until some railroad might need the corridor again for rail service. Because a railbanked corridor is not considered abandoned, it can be sold, leased or donated to a trail manager without reverting to adjacent landowners.

However, the FTA's draft letter failed to acknowledge that as the Interim Trail User, King County has affirmative duties under the Railbanking Legislation—duties that could be potentially jeopardized by the Project. The FTA's draft letter also failed to acknowledge the need to avoid "severing" the corridor or "stranding" any portion of it; or the need to preserve the corridor for potential restoration of freight service.

As the Trail User, King County cannot and will not authorize or allow any Project use of the Lake Trail corridor that would jeopardize the "railbanked" status of the corridor or permanently foreclose the potential to freight rail service in the future. However, King County believes that it may be possible to allow Project use of the Lake Trail corridor so long as such use is properly conditioned to preserve the corridor's "railbanked" status and protect the potential to restore freight service in the future. King County is willing to work with the FTA and Sound Transit to further refine the Project concept to meet these requirements. In exchange, and in connection with any grant of rights allowing Sound Transit to use the Lake Trail corridor for Project-related purposes, King County will require Sound Transit to execute the following covenants:

A. Sound Transit acknowledges that to protect the Lake Trail corridor as a rail transportation corridor, to preserve it for future reactivation of freight rail service, and to encourage energy efficient transportation uses, the Lake Trail corridor has been "rail banked" in accordance with 49 C.F.R. 1152.29 and Section 8(d) of the National Trails System Act (also known as the "Rails-to-Trails Act"), 16 U.S.C. 1247(d) (collectively, and as any of the foregoing may hereafter be amended or interpreted by binding judicial or administrative authority, the "Railbanking Legislation"). Sound Transit acknowledges that the Surface Transportation Board ("STB") approved King County as an Interim Trail User for the Lake Trail corridor for purposes of "railbanking" the corridor. Sound Transit acknowledges that under the Railbanking Legislation, King County, as the Interim Trail User, is subject to certain legal obligations related to the Property which are referred to herein as the "Railbanking Obligations".

B. Sound Transit covenants that it will comply with the Railbanking Obligations and that its use of the Lake Trail corridor will conform to the requirements of the Railbanking Legislation. Sound Transit covenants to cooperate with King County in good faith to fulfill the Railbanking Obligations in connection with Project use of the Lake Trail corridor.

C. Sound Transit covenants that if the STB receives a request for approval to use all or any portion of the Lake Trail corridor for reactivated freight rail service, including but not limited to such portion as Sound Transit may use in connection with the Project, then Sound Transit will cooperate with King County in order to cause the party making such request (including Sound Transit or King County): (i) to bear all costs to restore or improve the Lake Trail corridor for reactivated freight rail service; (ii) to bear all responsibility to take all steps necessary before the STB and any other regulatory agency, governmental or quasi-governmental body having jurisdiction over such work, to cause the relevant Notice of Interim Trail Use to be vacated, in whole or in part, as necessary; and (iii) to compensate King County and Sound Transit for the fair market value of any and all of their respective rights or interests in the Lake Trail corridor or improvements thereon (including, but not limited to, any Project-related improvements then located on or in the Lake Trail corridor)

> that may be destroyed, lost, compromised or otherwise reduced in value or function when the Lake Trail corridor or any portion of it is put to use for reactivated freight rail service.

Subject to these additional conditions and mitigation measures, as well as those previously identified by the FTA, and so long as the proposed mitigation is properly and fully implemented, King County conditionally concurs in FTA's *de minimis* finding regarding the Project's impacts on the Lake Trail.

MARYMOOR PARK

In its draft letter sent earlier this year, FTA summarized the Project's impacts to the Park as follows:

King County Park Facilities and Summary of Section 4(f) Use

Name of Resource	Significance Determination	Impact on Resource	Potential Mitigation	4(f) Findings after Mitigation
Marymoor Park/E2	Significant	Permanent use of about 2.0 acres	Acquire replacement recreation land equal in value and function to offset the light rail use within the Park property.	*de minimis*
		Temporary use of about 3.2 acres during construction	*Financial compensation for the temporary use of land outside the light rail right-of-way for construction.*	
			Park land restoration following construction	
		Temporary impacts to park use during construction		

FTA's draft letter also stated that

> Sound Transit will work with the appropriate agencies to address proposed changes to the Marymoor Park's wetland mitigation site. The Preferred Alternative E2 runs along the north end of a wetland mitigation site. This wetland was originally created to

> compensate for impacts on a natural wetland that occurred in the early 1990s during the widening of the SR 520. In 2000, as part of King County's project to develop the multi-use grass and soccer fields along the north end of the park, the wetland area was also impacted. In 2010, a "deed restriction document" for the site was prepared by King County.

The FTA's draft letter further stated that "the permanent and temporary use would occur on the northern edge [of the Park] and **no recreation facilities would be directly affected by operation**; however, an unofficial equestrian route would be affected." (Bracketed material, underlining, bolding added.)

In a separate 2011 memo prepared for Sound Transit by Michael Minor and Associates ("MMA"), MMA asserted that Sound Transit's light rail vehicles produce noise levels of 82 dBA L_{max} when traveling at 50 miles an hour (and measured 50 feet from the train). MMA asserted that this noise level was similar to that of heavy trucks and buses (84 to 86 dBA), and that when atmospheric dispersion is taken into account "[o]verall, maximum noise levels are not predicted to change with the installation of the . . . Project." MMA also concluded that at a predicted interval of 18 train trips per hour (peak hours), reduced to 8 train trips per hour (late evening and early morning), "vehicle traffic noise from SR 520 will continue to be the dominant noise source at the [P]ark." Finally, MMA concluded that the Project will not result in a measurable difference in the overall noise levels at the active areas of the Park, including the baseball fields, soccer fields, entertainment pad and velodrome.

For the reasons set forth below, **King County does not concur in the FTA's *de minimis* finding regarding the Project's impacts to Marymoor Park**. More specifically, King County rejects the FTA's assertion that Sound Transit's train operations will not affect the Park through noise and vibration. We believe that the FTA's analysis and MMA's memo suffer from certain critical shortcomings, and that those shortcomings gloss over potential noise and vibration impacts to the Park, as well as mitigation opportunities to address them.

ANALYTICAL FLAWS REGARDING NOISE AND VIBRATION IMPACTS TO THE PARK

We believe that there are at least two analytical flaws in the FTA's de minimis conclusion regarding noise and vibration impacts to the Park. First, the FTA and MMA did not properly consider the variety, pitch, and periodicity of noise impacts that may be generated by Sound Transit train operations; and second, the FTA did not properly consider the noise sensitivity of the Park. We address each of these in turn.

THE FTA DID NOT CONSIDER THE VARIETY, PITCH, AND PERIODICITY OF NOISE IMPACTS THAT MAY BE GENERATED BY SOUND TRANSIT OPERATIONS

The MMA memo does not distinguish between the various types of noise that Sound Transit light rail vehicles may generate. For example, a train may generate engine noise, air noise (the sound of the vehicle displacing air), brake noise, wheel noise (bearings and brakes), track noise (joints, curves, crossovers, etc.), and bell, horn, or other warning signal noise.

Some of these noises may be much louder than the 82 dBA L_{max} level identified by MMA. For example, based on its experience with Central Link, Sound Transit has specified that the maximum sound level for train wheels passing over the rail gaps in a standard track crossover is 90 dBA L_{max} (measured at 50 feet from train). The 90 dBA L_{max} is substantially louder than 82 dBA L_{max}: Since the decibel scale is logarthmic, an 8 dBA increase represents a doubling or near-doubling of loudness. The MMA memo does not discuss the location of crossover tracks, or whether these twice-as-loud track noises might affect Park users. Nor does the FTA or MMA propose any mitigation to address such noises, which might include special track to eliminate the wheel impacts responsible for the loud noises; or wheel skirts.

Intermittent noises such as wheel squeal on track curves can also be substantially louder and more disruptive than straight-line train operation. The MMA memo does not discuss the radius of any track curves near the Park, or whether any such curves might produce loud, intermittent wheel squeal that could affect Park users. Nor does the FTA or MMA propose any mitigation to address such noises, which might include designing the Project to include gentler curves; or, if a gentle curve is not feasible, automated track lubricators or a program of track grinding and wheel truing.

Similarly, some of these noises, such as bell, horn, or other warning signal noise, are specifically designed to stand out against background noise, and to capture people's attention—that is their function. The intermittent or unpredictable nature of these sounds, together with their tonal, high frequency character, mean that these noises are likely to be more irritating than a constant, broader-frequency sound, even if the overall sound level is the same. MMA's memo acknowledges that there will be a Sound Transit station just east of the Park, but does not discuss the noise impacts of slowing trains (wheel bearings, braking, crossovers) or warning signals (bells, horns, etc.) that necessarily accompany train arrivals and departures at a station.

Finally, we are also concerned that other the FTA/Sound Transit noise studies have averaged short-term noise sources (bells, etc.) over a 24-hour period. While this may be in keeping with the FTA methodology, it does not fully reveal the noise level the community experiences. Averaging the sound of a short-duration noise over a 24-hour period will tend to obscure the "impact" that each such event may have. Also, there is no evidence that the FTA or Sound Transit have attempted to evaluate sound reflected off of barriers (noise walls, retaining walls, jersey barriers, etc. We believe that the FTA's noise analysis regarding the Park should include reflected sound impacts. Likewise there should be a full discussion of construction-related impacts, which may not occur in perpetuity but could be substantial and significant during the period of construction.

FTA DID NOT PROPERLY CONSIDER THE NOISE SENSITIVITY OF THE PARK

The MMA memo states that EPA typically considers residential land use to be a more sensitive land use type than parks. However, the FTA has its own criteria for noise sensitivity. The FTA guidelines state that (bolding added):

> Parks are a special case. Whether a park is noise-sensitive depends on how it is used. Most parks used primarily for active recreation would not be considered noise-sensitive. However, some parks—even some in dense urban areas—are used for passive recreation like reading, conversation, meditation, etc. These places are valued as havens from the noise and rapid pace of everyday city life and they should be treated as noise-sensitive. **The noise sensitivity of parks should be determined on a case-by-case basis after carefully considering how each facility is used. The state or local agency with jurisdiction over the park should be consulted on questions about how the park is used and how much use it gets.**

Under the FTA's own criteria, there is ample evidence that additional consideration should be given to the noise sensitivity of the Park. Even if noise impacts are limited to that portion of the Park located closest to the SR-520 corridor, those impacts are or may be significant. From west to east, the portion of Marymoor Park closest to SR-522 consists of facilities dedicated to the following uses: three baseball diamonds; four tennis courts; two multisport fields; a reflexology path; three artificial turf soccer fields; a wetlands area; a cricket pitch; a recreation and event area; a velodrome; and a climbing rock.

Each of these facilities serves a noise-sensitive use that could be impacted by periodic loud noises from Sound Transit train operations. Tennis, cricket, and rockclimbing are classic examples of sports that require tremendous concentration and freedom from distractions in order to properly execute the skills needed to perform them: We are all familiar with television images of a tennis umpire scolding a noisy fan in the bleachers for merely *clapping* while a player is preparing to serve. Periodic horn blasts, unexpected brake squeal, or 90-decibel wheel impacts would be far more intrusive. Similarly, soccer and baseball referees must be able to reliably communicate with and control players over distances by voice and whistle alone—sounds that could be easily drowned out by the sounds of a train on a crossover. Track cycling is a high-speed, close-quarters competition where even a moment's inattention can lead to a severe crash with traumatic injuries. What will happen if a warning bell sounds unexpectedly as two sprinters are racing for the line, elbow-to-elbow with their wheels just centimeters apart at

35 mph? And what of the reflexology path user, attempting to improve circulation and reduce overall stress through the ancient, meditative practice of mindful breathing while walking barefoot over protruding stones? Habitat and wildlife viewing associated with the wetlands adjacent to the Event Pad may also be affected.

Finally, King County rents the Event Pad to a variety of users, including dog shows, camping groups, black-tie fundraising galas, and, of course, the Cirque du Soleil. Each of these are noise-sensitive uses in their own right; they cannot be conducted in an environment subject to periodic, exceptionally loud bangs, squeals, bells or whistles. Together, they produce substantial revenue to the County, all of which is plowed back in the park and recreation system. **If noise or vibration from Sound Transit's train system impacts the County's ability to rent the Event Pad, it could jeopardize the County's strategy to fund regional parks and recreation over the long term.** This strategy is mandatory for the Division. See King County Ordinance 14509 §1.A.1, -.6 (finding that the County must find new ways of generating revenue, and finding that it is appropriate for the Division to "develop . . . entrepreneurial ways of doing business").

NEED FOR FURTHER REVIEW AND MITIGATION REGARDING THE PARK

Many other activities and uses in the Park are noise sensitive in varying ways and degrees. To begin, the FTA must acknowledge that one of the primary functions of a park is to allow people to escape the hustle and bustle of their everyday urban existence for the peace and quiet of a park. How is it possible that Meydenbauer Center in Bellevue—a large, concrete-and-steel reinforced structure used for indoor purposes—is deemed a sensitive noise receptor structure, while the many open-air recreation facilities located in the northern tier of Marymoor Park are not?

As discussed earlier, it is not just a question of noise volume, or noise frequency, but also noise quality. For example, the noise from Highway 520 is more of a constant hum that can be relegated to background noise, while a train coming by intermittently is startling as each train passes by. Intermittent noise will have a far greater impact than the background noise of roads. Quiet or contemplative uses will be impacted as will conversation between walkers or picnickers. Similarly, scheduled Park uses such as weddings, parties, and concerts could also be affected.

A potential secondary noise issue or indirect effect of the Project is that loudspeaker systems for events held at the velodrome or sports fields may need to operate at higher volume due to train-related noise, which would thus further impacting other park users and the neighbors who are already sensitive to the existing volume levels.

CONCLUSION

Section §4(f) of the 1966 Highway Act requires that the FTA consider any impact avoidance, minimization, and mitigation or enhancement measures before making a finding of *de minimis* impacts. For all of the reasons discussed above, the Division declines to endorse a *de minimis* finding without more structured analysis of the noise and vibration impacts that Sound Transit's operations could have on the many uses of the Park along SR-522.

Sound can be mitigated at the source, along the path between source and receiver, or at the receiver. It is preferable to treat the noise at the source whenever possible. Without a full discussion of noise sources and possible mitigation methods to control East Link train noise at the source, the Division cannot completely concur in the FTA's *de minimis* finding determination at this point in time.

As a result, **we conditionally concur in FTA's *de minimis* finding regarding Project's impacts on the River Trail**, so long as the proposed mitigation is properly and fully implemented as described in this letter. Also, **we conditionally concur in the FTA's *de minimis* finding regarding East Link's impacts on the Lake Trail**, so long as the proposed mitigation is properly and fully implemented, and so long as Sound Transit covenants to comply with all applicable "railbanking" requirements, all as discussed in this letter. However, at the present time **King County does not concur in the FTA's *de minimis* finding regarding the Project's impacts to the Park**. We request that the FTA and Sound Transit perform the additional review, analysis, and mitigation planning discussed above.

Our review of the Project's potential impacts and mitigation measures is based on current analyses and the information about the Project. In the event that new or additional information becomes available as the Project is refined, King County will gladly reconsider its rejection of the FTA's *de minimis* conclusions regarding the Project's impacts on Marymoor Park. The Division looks forward to coordinating with Sound Transit to further review design and construction elements of the Project as it progresses.

Sincerely,

Kevin R Brown

Subject: East Link Light Rail Project

Dear Mr. Krochalis,

Thank you for the opportunity to review and comment on your Determination of Adverse Effect on Section 106 resources for the East Link Light Rail Project and the invitation to participate as a consulting party under the Section 106 process for this project.

We have no comments on the Determination of Adverse Effect and we accept your invitation to participate as a consulting party.

You may continue to use me as a point of contact during the Section 106 process. If you have any questions, please call me at (206) 805-2892 or email me at paul.krueger@wsdot.wa.gov.

Sincerely,

Paul Krueger

Appendix E

Operating Plan Summary

Appendix E

Operating Plan Summary

This weekday operating plan was used for environmental impact analysis in the Final Environmental Impact Statement (Final EIS) for the East Link Project. By year 2020, East Link is proposed to be constructed from Seattle to an interim terminus, either the Hospital Station in Segment C or another station in Segment D. For year 2030, the service plan was analyzed to operate between Seattle and the Redmond terminus station.

The assumed weekday operating plan in 2020 has the following service patterns:

- Peak periods (6:00 a.m. to 8:30 a.m. and 3:00 p.m. to 6:30 p.m.): three-car trains every 8 minutes.
- Midday (8:30 a.m. to 3:00 p.m.) and early evening (6:30 p.m. to 10:00 p.m.): three-car trains every 12 minutes.
- Early morning (5:00 a.m. to 6:00 a.m.) and late evening (10:00 p.m. to 1:00 a.m.): three-car trains with 15-minute headway.

The assumed Saturday and Sunday operating plan in 2020 is three-car trains with 15-minute headway in the early morning and late evening, and three-car trains with 12-minute headway for the midday period (8:00 a.m. to 10:00 p.m.).

The assumed weekday operating plan in 2030 has the following service patterns:

- Peak periods (6:00 a.m. to 8:30 a.m. and 3:00 p.m. to 6:30 p.m.): three-car trains every 7 minutes.
- Midday (8:30 a.m. to 3:00 p.m.) and early evening (6:30 p.m. to 10:00 p.m.): three-car trains with 10-minute headway.
- Early morning (5:00 a.m. to 6:00 a.m.) and late evening (10:00 p.m. to 1:00 a.m.): three-car trains with 15-minute headway.

The assumed Saturday and Sunday operating plan in 2030 is three-car trains with 15-minute headway in the early morning and late evening, and three-car trains with 10-minute headway for the midday period (8:00 a.m. to 10:00 p.m.).

Table E-1 lists the days and hours when each service pattern would operate. Service would be more specifically tailored to the transition periods (for example, between early morning and peak hour).

TABLE E-1
Assumed East Link Operating Schedule

	From	To	Number of Hours	Service Type
Weekday	5:00 a.m.	6:00 a.m.	1.0	Early/late
	6:00 a.m.	8:30 a.m.	2.5	Peak
	8:30 a.m.	3:00 p.m.	6.5	Base
	3:00 p.m.	6:30 p.m.	3.5	Peak
	6:30 p.m.	10:00 p.m.	3.5	Base
	10:00 p.m.	1:00 a.m.	3.0	Early/late
Saturday	5:00 a.m.	8:00 a.m.	3.0	Early/late
	8:00 a.m.	10:00 p.m.	14.0	Base
	10:00 p.m.	1:00 a.m.	3.0	Early/late
Sunday	6:00 a.m.	8:00 a.m.	2.0	Early/late
	8:00 a.m.	10:00 p.m.	14.0	Base
	10:00 p.m.	12:00 a.m.	2.0	Early/late

Train lengths are based on projected ridership and the following loading standards: maximum vehicle load factors (riders per seat) of approximately one during the midday and early/late service periods and two during peak periods (74 seats per vehicle). Operating schedules and train lengths would be adjusted in response to actual ridership.

Appendix F4.2

Land Use Plans, Goals, and Policies

Appendix F4.2

Land Use Plans, Goals, and Policies

F4.2.1 Introduction

Sound Transit reviewed regional, state, local, and major institution master plans to identify goals and/or policies applicable to the East Link Project. The following sections summarize the applicable plans and discuss the proposed project's consistency with them. Table F4.2-1 at the end of the text provides information on specific goals and policies in the relevant plans, and the consistency of the East Link Project with each of them. The table lists each plan and presents the text of the applicable plan element and any subsections, identifies whether the East Link Project is consistent with the goal or policy, and discusses how the project is consistent. The text addresses specific goals and policies, and there are many policies not listed because they are not applicable and/or relevant to East Link (i.e., the policies address an area outside of the East Link Project study area). The East Link Project would also be required to comply with all permits and approvals from the applicable federal, state, and local agencies prior to construction. The route and station alternatives are substantially consistent with plans and polices in the study area. A maintenance facility could be located at one of these locations in Segment D (MF1, 116th; MF2, BNSF; and MF3, SR 520) or Segment E (MF5, SE Redmond). Under the Bel-Red Subarea Plan current zoning, a maintenance facility would not be permitted in the Bel-Red Corridor area, but the City of Bellevue would work with Sound Transit to determine the need for a maintenance facility and, if required, the siting of the facility. The MF5 is consistent with existing plans and policies for the proposed locations.

F4.2.2 Regional and State Land Use Plans

There are five regional and state planning documents that establish the framework for local land use and transportation plans and programs: the Washington State Growth Management Act (GMA), *VISION 2040/Transportation 2040*, Sound Transit's Regional Transit Long-Range Plan, and the King County Comprehensive Plan. The following subsections provide an overview of each.

F4.2.2.1 Growth Management Act

Plan Summary

The GMA (Revised Code of Washington [RCW] 36.70A), adopted in 1990 to mandate comprehensive planning, provides a comprehensive framework for managing growth and coordinating land use development with the construction of transportation facilities and other infrastructure. Local, county, and regional plans in Washington are required to be consistent with the policies of the GMA. The GMA includes 13 planning goals for managing urban growth, protecting agricultural lands, reducing sprawl, and encouraging multimodal transportation systems. The overall goals of the GMA encourage development in urban areas where adequate public facilities and services exist or can be provided in an efficient manner, and encourage efficient multimodal transportation systems that are based on regional priorities and are coordinated with county and city comprehensive plans.

Affected jurisdictions, including the Cities of Seattle, Mercer Island, Bellevue, and Redmond, keep pace with land development by making public road and transit improvements to help meet the expected transportation demand. The GMA requires local governments to develop and adopt growth management policies, plans, and regulations. Comprehensive plans require elements that address land use, housing, capital facilities, utilities, rural lands (counties only), and transportation. In addition, the transportation element is required to be consistent with the land use element. Coordination of land use and transportation is a key component of the GMA. Cities and counties are also mandated by the GMA to establish a process in their comprehensive plans to make the provision for siting essential public facilities, such as airports, state or regional transportation and transit facilities, solid waste handling facilities, mental health facilities, group homes, and secure community transition facilities.

Project Consistency

The East Link Project alternatives and stations are located within the Cities of Seattle, Mercer Island, Bellevue, and Redmond, and all have adopted comprehensive plans and regulations, which are generally, but not entirely, consistent with the provisions identified in the GMA. The East Link

Project would connect the four cities and their centers of employment and activity and would further the goals of the GMA. In addition, the East Link Project is considered an essential public facility and, as such, under GMA. When Sound Transit's routing decision is final, the Cities have a "duty to accommodate" the light rail project in their land use plans. The East Link Project is consistent with GMA in that it would encourage growth within the urban area, reduce sprawl, and provide a transportation alternative to the single-occupant vehicle (SOV).

F4.2.2.2 VISION 2040

Plan Summary

VISION 2040, adopted in 2008 by the Puget Sound Regional Council (PSRC), serves as the region's integrated long-range growth management strategy for the four-county area the Council serves (King County, Snohomish County, Pierce County, and Kitsap County). It builds from PSRC's *VISION 2020* plan and expands the focus on sustainability in the incorporation of a projected additional 1.7 million people in the Puget Sound region by 2040. It promotes the development of a coordinated transportation system that is integrated with and supported by the growth management strategy and builds upon and supports local, countywide, regional, and state planning efforts. Countywide planning policies in each of the counties supply the local framework and provide additional detail for county and city comprehensive plans. *VISION 2040* strategies and polices are located within six elements: Environment; Development Patterns; Housing; Economy; Transportation; and Public Services.

VISION 2040's focus is to contain growth, concentrate new employment into urban centers, and link the centers with a high-quality multimodal transportation system. This strategy is designed to foster a greater mix of land uses and a more complete and efficient network of streets and other public rights-of way, and to support an urban environment that is more amenable to walking, bicycling, and using transit. *VISION 2040* contains many goals and policies that are applicable to the East Link Project.

Project Consistency

Table F4.2-1 provides information on the goals and policies of *VISION 2040* and how the East Link Project is consistent with these.

F4.2.2.3 Transportation 2040

Plan Summary

Transportation 2040, adopted in May 2010, is the long-range plan for transportation in the central Puget Sound region through the year 2040 and is the transportation element of *VISION 2040*. The transportation-related plans of the cities, counties, transit agencies, and the region form the basis for the *Transportation 2040* plan. The plan looks at the needs of the Central Puget Sound Region and identifies what improvements in transportation are needed in order to meet the anticipated growth. *Transportation 2040* supports a balanced multimodal transportation system that provides options to users, and the plan identifies the specific projects that have been designed to result in improved roads, transit, ferry, aviation, and nonmotorized service.

Project Consistency

The East Link Project is identified in *Transportation 2040* and is a key component in the development of a regional high-capacity system linking urban centers. In addition, the East Link Project would allow for jurisdictions to better implement transit- and pedestrian-oriented land use patterns where current zoning allows for such development to occur.

F4.2.2.4 Sound Transit - Regional Transit Long-Range Plan

Plan Summary

Updated in 2005, Sound Transit's Regional Transit Long-Range Plan represents the goals, polices, and strategies for the long-term development of a high-capacity transit (HCT) system within the Central Puget Sound Region. As the Regional Transit Authority (under Chapters 81.104 and 81.112 RCW), Sound Transit is responsible for regional HCT system planning in the context of *Transportation 2040*. The Long-Range Plan serves as the basis for the next phase of HCT investments, known as The Regional Transit System Plan for Central Puget Sound (ST2). ST2 builds upon Sound Move, the initial implementation phase of the Long-Range Plan, and extends the regional transit network, especially in areas that are now encouraging increases in land use density in their comprehensive plans and development regulations. The East Link Light Rail Transit Project is included in ST2, also known as the Mass Transit Expansion proposal, which was approved by the voters in November 2008.

Project Consistency

East Link is a proposed regional HCT system project that is consistent with the Long-Range Plan.

F4.2.2.5 King County Comprehensive Plan

Plan Summary

The King County Comprehensive Plan was adopted October 2008, and was updated in October 2010. The

King County Countywide Planning Policies (CPPs) set the framework for county and city comprehensive plans. The CPPs address issues that transcend city boundaries, such as setting urban growth areas, accommodating housing and job demand, and addressing capital facilities that are regional in nature, as well as providing a framework to promote consistency among a multitude of city plans.

Goals include reducing urban sprawl, protecting rural areas, providing affordable housing throughout the county, and coordinating protection of environmentally sensitive areas. The CPPs call for urban centers to provide areas of concentrated employment and housing with direct service by high-capacity transit and with a wide range of land uses. In this context, the East Link Project is an important element of the region's growth strategy.

Project Consistency

Table F4.2-1 discusses the goals and policies of the King County CPPs and how the East Link Project is consistent with these.

F4.2.3 Local Land Use Plans and Shoreline Management Plans

F4.2.3.1 City of Seattle Comprehensive Plan

Plan Summary

Seattle's Comprehensive Plan: Towards a Sustainable Seattle, which was first adopted in 1994, had major updates in 2004, and is amended annually, was developed to communicate how Seattle will accommodate residential and employment growth over the next 20 years. The plan consists of 11 elements that each contain goals and policies for guiding growth in Seattle: Urban Village, Land Use, Transportation, Housing, Capital Facilities, Utilities, Economic Development, Neighborhood Planning, Human Development, Cultural Resource, and Environment. Sound Transit reviewed the elements to identify the applicable goals and policies. The only elements with applicable goals and policies were in the Transportation and Neighborhood elements.

Project Consistency

Table F4.2-1 discusses the goals and policies of Seattle's Comprehensive Plan and how the East Link Project is consistent with these.

F4.2.3.2 City of Seattle Neighborhood Planning Element

The East Link Project is located within existing Washington State Department of Transportation (WSDOT) I-90 right-of-way within Seattle and is adjacent to the neighborhoods of International District/Chinatown North Rainer Valley and the Central Area. These neighborhood boundaries are defined by the WSDOT I-90 right-of-way, so the *Preferred I-90 Alternative (A1)* is not formally located within any neighborhood. The project team reviewed the neighborhood plans for consistency; however, there are no goals or policies that relate to transit along or associated with I-90. The plans' primary focus is on the activity centers located toward the center of the neighborhoods and outside of the study area.

F4.2.3.3 Shoreline Master Programs

Jurisdictions are required by the Washington State Department of Ecology (Ecology) to amend their Shoreline Master Programs (SMPs) every 7 years. The goal of the update planning process is to make the SMP a more effective tool for defining and implementing a jurisdiction's vision for the shoreline. The state established a December 2009 deadline for jurisdictions in King County to adopt the updated SMPs; however, many jurisdictions have been given an extension in which to update their SMPs. The update process and policy outcomes must comply with new guidance established by Ecology under the Shoreline Management Act (Washington Administrative Code [WAC] 173-26; RCW 90.58).

Seattle Shoreline Master Program

Seattle amended Seattle Municipal Code 23.60 (Shoreline District) to adopt changes pertaining to light rail development in the Shoreline District in recent years. In addition, Seattle Municipal Code 23.42 (General Use Provisions) and 23.80 (Essential Public Facilities) were also updated. Updates to the SMP include the following:

- Light rail transit facilities are allowed in all shoreline environments.
- Light rail bridges and tunnels are considered water-dependent uses.
- Shoreline substantial development permits only pertain to the portions of a linear transportation system (i.e., light rail) within the shoreline area rather than the entire project.
- Intermittent and temporary construction uses for light rail construction may be allowed in the shoreline district.

Redmond Shoreline Master Program

The City of Redmond adopted a new Shoreline Master Program by Ordinance 2410 in August 2008. The new SMP is contained in Redmond Municipal Code

20D.150 (Shoreline Master Program) and includes many changes to accommodate the regional light rail system in the Shoreline District. Updates to the SMP include the following:

- A new definition of Regional Light Rail Transit System was added.
- Light rail transit facilities are allowed in all shoreline environments in which Sound Transit would potentially need to locate its regional light rail system.
- Regional light rail transit systems are allowed as in-water structures.
- Light rail bridges are a permitted use in all shoreline buffers.
- New and replacement protective structures for regional light rail facilities are allowed in shorelines.

The SMP identifies the placement of essential transportation facilities waterward of the ordinary high water mark where no feasible alternative exists and any fish impacts are mitigated.

King County Shoreline Master Program

King County adopted a new SMP by Ordinance 16985 in December 2010. The new SMP adds development regulations for shoreline zones into Title 21A of the King County Code. These new regulations include changes to accommodate light rail in the Shoreline District. Updates to the SMP include the following:

- A new definition of Regional Light Rail Transit System was added.
- Light rail transit facilities are allowed in all shoreline environments.
- Light rail transit support structures are allowed to exceed height restrictions.
- Alterations to critical areas are allowed for light rail transit.

Shoreline Master Programs for Mercer Island and Bellevue

The Cities of Mercer Island and Bellevue are currently updating their SMPs in conformance with the requirement of Ecology. When updated, the SMPs are likely to include updates related to light rail corridors within the shoreline jurisdiction, including text similar to that adopted by Seattle and Redmond. Sound Transit is actively working with each of the jurisdictions on their SMPs to ensure that shoreline policies and regulations pertaining to regional light rail transit are consistent between jurisdictions.

Project Consistency

When the code updates have been adopted, any alternatives within the shoreline environment would be consistent with the applicable jurisdiction’s SMP. The East Link Project would need to comply with permit requirements for any work within the shoreline environment.

F4.2.3.4 Comprehensive Plan of the City of Mercer Island

Plan Summary

The *Comprehensive Plan of the City of Mercer Island* was adopted in 1994 and last updated in 2004. The comprehensive plan is used to reinforce the long-term goal of maintaining a single-family community within a unique physical setting and focusing growth and revitalizing the Town Center. The comprehensive plan is divided into five elements: Land Use, Housing, Transportation, Utilities, and Capital Facilities.

Project Consistency

Table F4.2-1 discusses the goals and policies of the City of Mercer Island’s Comprehensive Plan and how the East Link Project is consistent with those.

The City Council of Mercer Island also adopted design principles for Mercer Island Town Center Light Rail in 2008. Twelve principles identify what should be included in the design of the station and the immediate area around the station. These principles address what design should incorporate regarding aesthetics, Crime Prevention through Environmental Design (CPTED), energy efficiency, and wayfinding.

F4.2.3.5 City of Bellevue Comprehensive Plan

Plan Summary

Originally adopted in 1993, the *City of Bellevue Comprehensive Plan* was updated in 2006. The plan is a broad statement of community goals and policies divided into 12 elements that direct the orderly and coordinated physical development of the city into the future. Elements with goals and policies related to the East Link Project include Land Use, Transportation, Capital Facilities, Urban Design, and Environmental.

Consistency

Table F4.2-1 discusses the goals and policies of the City of Bellevue’s Comprehensive Plan and how the East Link Project is consistent with those.

While East Link is generally consistent with the city's comprehensive plan and subarea plans, there are certain inconsistencies with local zoning. For example, in the City of Bellevue Land Use Code, “light rail transit facilities” are not defined and are not called out as a permissible use in any zone; "rail transportation" is allowed as a conditional use in all zones except the downtown zones, where it is expressly not allowed as either a permitted or conditional use; a maintenance facility may not be allowed in the Bel-Red Corridor. When Sound Transit has selected the East Link Project to be built, the City will need to either amend their comprehensive plan and subarea plans, or waive any inconsistencies to accommodate light rail as an essential public facility.

F4.2.3.6 City of Bellevue Subarea Plans

Plan Summary

Bellevue is divided into 14 subareas, each with its own subarea plan and with specific goals and policies developed with citizen participation to help maintain the unique characteristics and quality of life for the subarea residents. Subareas with boundaries that overlap or that the East Link Project alternatives would travel through include Southwest Bellevue, Richards Valley, Downtown, Wilburton/NE 8th, and Bel-Red/Northup.

The City of Bellevue adopted new policies, land use designations, and zoning through amendments to the City of Bellevue's Comprehensive Plan, the Bel-Red/Northup Subarea Plan, and made changes to the maps for the Crossroads Subarea Plan and the Wilburton/NE 8th Subarea Plan.

Project Consistency

Southwest Bellevue/Richards Valley/Wilburton/NE 8th Subarea Plan

Table F4.2-1 discusses the goals and policies of these primarily residential neighborhood areas and how the East Link Project is consistent with the applicable goals and policies.

Downtown Subarea Plan

The portions of the Downtown Subarea Plan that address the East Link Project include emphasis on mixed-use and pedestrian-oriented development patterns. The East Link Project is consistent with and will help realize the goals of the Downtown Subarea Plan.

Bel-Red Subarea Plan

City of Bellevue adopted the Bel-Red Subarea Plan in February 2009 and amended their comprehensive plan to incorporate these changes.

With the amendments in place, the Bel-Red Subarea would accommodate approximately 4.5 million square feet of commercial and office space and 5,000 residential units. A Washington State Environmental Policy Act environmental impact statement (EIS) was completed to evaluate the impacts of adopting new policies, land use designations, and zoning. The EIS identifies the City of Bellevue's preferred Bel-Red alternative route for light rail traveling through the middle of the corridor.

The East Link Project would allow Bellevue to develop and implement the desired densities and land uses within the Bel-Red area and would be consistent with the regional policies of encouraging growth in urban centers along multimodal transportation corridors. However, the SR 520 Alternative (D5), although consistent with many of the plans and policies, would not allow the opportunity to fully implement the adopted policies for the Bel-Red neighborhood regarding development at the nodes identified in the plan. In addition, depending on where the initial East Link terminus would be, a maintenance facility may be required in Bellevue. Under current zoning, a maintenance facility is considered a conditional use in the Bel-Red Corridor area. City of Bellevue included language per S- B-70 that the City would work with Sound Transit on the location of a maintenance facility if sited in this area.

F4.2.3.7 Eastside Transportation Program

Plan Summary

In addition to the subarea plans, Bellevue adopted the Eastside Transportation Program in order to address transportation issues on the east side of Lake Washington. Besides Bellevue, other participants include the Cities of Bothell, Issaquah, Kirkland, and Redmond; King County, WSDOT; the Puget Sound Council of Governments; King County Metro; and members of the private sector.

Project Consistency

Table F4.2-1 discusses the goals and policies of the Eastside Transportation Program and how the East Link Project is consistent with these.

F4.2.3.8 Bellevue Light Rail Best Practices

The City of Bellevue has developed light rail best practices for the implementation of light rail. The report, *Bellevue Light Rail Best Practices* (Bellevue 2008), was finalized in 2008, cross-references policies from the comprehensive plan that are identified in this appendix. The report was developed by the Light Rail Best Practices Committee, which was comprised of 10 members representing four City boards and commissions and the Bellevue City Council. The committee identified research issues, reviewed national practices for light rail and case studies, and took into consideration public input in the development of the report, but did not develop any conclusions about light rail routes or alternatives.

The report contains information on findings from the reviews and case studies; best practices, which includes the processes, methods, and activities; and five categories of recommended actions, which include Comprehensive Plan Policies, Codes and Standards, Other City Policies/Procedures, City Capital Investments, and Expectations of Sound Transit.

The committee identified five guiding principles that should serve during the development of the light rail project. They also identified nine topic areas to guide the implementation of light rail in Bellevue, including Community and Neighborhoods; Community Involvement; Connecting People to Light Rail; Land Use; Street Design and Operations; Elevated, At-Grade, and Tunnel; Property Values; Station Security; and Construction Impacts and Mitigation. The nine topics include information on the findings, best practices, and actions described above.

F4.2.3.9 Overlake Hospital Medical Center

Plan Summary

The 2005 Master Development Plan Amendment, prepared in January 2005, amends the 2000 Overlake Hospital Master Development Plan. In 2005, in order to allow the Overlake Hospital to expand to accommodate the changing needs of health care, the City of Bellevue amended the land use codes to allow for the required changes. The amendments provide for a greater density of development than was previously allowed.

Project Consistency

Stations located close to the Overlake Hospital Medical Center would provide nonauto-oriented access to the Overlake facility, the Group Health Medical Center, Seattle Children's Hospital in Bellevue, and the medical offices located nearby.

F4.2.3.10 City of Redmond Comprehensive Plan

Plan Summary

The *Redmond Comprehensive Plan*, originally adopted in 1995, was updated in 2004/2005. The plan sets out the policies to reflect community values and guide decisions about growth and change and is the policy portion of the Community Development Guide. It is a statement of the City of Redmond's goals for the future and how these goals will be achieved. The plan consists of 15 elements that support the vision of the city. Elements related to the East Link Project include Land Use, Transportation, and Neighborhoods.

Project Consistency

Table F4.2-1 discusses the goals and policies of Redmond's Comprehensive Plan and how the East Link Project is consistent with those.

F4.2.3.11 City of Redmond Neighborhood Planning Element

Plan Summary

In addition to Redmond's Comprehensive Plan, neighborhoods within Redmond have developed neighborhood plans with their own set of goals and policies. The East Link Project includes alternatives that would travel through, and have stations located within, the Overlake, Southeast Redmond, Grass Lawn, and Downtown Redmond neighborhoods. Redmond recently adopted changes related to the Overlake neighborhood to promote transit-oriented development supported by light rail.

Project Consistency

Table F4.2-1 discusses the goals and policies of Redmond's neighborhood plans and how the East Link Project is consistent with these.

TABLE F4.2-1
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
VISION 2040	
DEVELOPMENT PATTERNS	
Goal: The region will direct growth and development to a limited number of designated regional growth centers. **MPP-DP-5** Focus a significant share of population and employment growth in designated regional growth centers. **MPP-DP-6** Provide a regional framework for designating and evaluating regional growth centers. **MPP-DP-7** Give funding priority – both for transportation infrastructure and for economic development – to support designated regional growth centers consistent with the regional vision. Regional funds are prioritized to regional growth centers. County-level and local funding are also appropriate to prioritize to regional growth centers. **MPP-DP-35** Develop high-quality, compact urban communities throughout the region's urban growth area that impart a sense of place, preserve local character, provide for mixed uses and choices in housing types, and encourage walking, bicycling, and transit use.	The East Link Project would promote mixed-use (commercial, office, and residential) development to allow growth at greater density where existing land use policies and regulations allow, and provide connections to urban centers with a fast, efficient, and reliable transit system.
Goal: Subregional centers, such as those designated through countywide processes or identified locally, will also play important roles in accommodating planned growth according to the regional vision. These centers will promote pedestrian connections and support transit-oriented uses. **MPP-DP-14** Preserve and enhance existing neighborhoods and create vibrant, sustainable compact urban communities that provide diverse choices in housing types, a high degree of connectivity in the street network to accommodate walking, bicycling and transit use, and sufficient public spaces. **MPP-DP-17** Promote transit service to and from existing cities in rural areas.	The East Link Project would act as a catalyst for mixed-use development (commercial, office, and residential) in designated urban growth areas and would focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. The East Link Project would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities as well as regional destinations. Linking the urban centers with fast, reliable, and efficient transit increases the effectiveness of distribution bus transit to outer areas of the Puget Sound.
Goal: The region will permanently sustain the ecological functions, resource value, lifestyle, and character of rural lands for future generations by limiting the types and intensities of development in rural areas. **MPP-DP-21** Contribute to improved ecological functions and more appropriate use of rural lands by minimizing impacts through innovative and environmentally sensitive land use management and development practices. **MPP-DP-22** Do not allow urban net densities in rural and resource areas.	The East Link Project would promote mixed-use (commercial, office, and residential) development to allow growth at greater density where existing land use policies and regulations allow, and provide connections to urban centers with a fast, efficient, and reliable transit system, which prevent the need for growth in nonurban areas. Increasing density in these areas will lessen demand on rural areas and allow them to be preserved for these preferred values.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Goal: The region will use design to shape the physical environment in order to create more livable communities, better integrate land use and transportation systems, and improve efforts to restore the environment. **MPP-DP-35** Develop high-quality, compact urban communities throughout the region's urban growth area that impart a sense of place, preserve local character, provide for mixed uses and choices in housing types, and encourage walking, bicycling, and transit use. **MPP-DP-36** Provide a wide range of building and community types to serve the needs of a diverse population. **MPP-DP-40** Design transportation projects and other infrastructure to achieve community development objectives and improve communities. **MPP-DP-42** Recognize and work with linear systems that cross jurisdictional boundaries – including natural systems, continuous land use patterns, and transportation and infrastructure systems – in community planning, development, and design.	The East Link Project would provide a fast, efficient, and reliable transportation system that would provide an alternative to the SOVand would also provide linkages to other travel modes, including rail, buses, and walking. Efficiencies in transportation and more walkable communities are shown to improve people’s quality of life.
TRANSPORTATION	
Goal: As a high priority, the region will maintain, preserve, and operate its existing transportation system in a safe and usable state. (MPP-T-1 through MPP-T-8). **MPP-T-1** Maintain and operate transportation systems to provide safe, efficient, and reliable movement of people. **MPP-T-3** Reduce the need for new capital improvements through investments in operations, pricing programs, demand management strategies, and system management activities that improve the efficiency of the current system, goods, and services. **MPP-T-5** Foster a less polluting system that reduces the negative effects of transportation infrastructure and operation on the climate and natural environment. **MPP-T-6** Seek the development and implementation of transportation modes and technologies that are energy efficient and improve system performance.	The East Link Project would be a fast, efficient, and reliable transportation system that would provide an alternative to the SOV and would also provide linkages to other travel modes, including rail, buses, and walking. East Link would provide connections among urban centers, which would reduce the need to expand other transportation facilities. Overall, less infrastructure development would be needed with this higher-density development. The East Link Project would reduce air pollution and conserve energy. Many of the stations would be located in areas designated for increased density, and East Link would provide direct and frequent access to other centers in the project corridor, as well as providing connections to regional destinations.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Goal: The future transportation system will support the regional growth strategy by focusing on connecting centers with a highly efficient multimodal transportation network. (MPP-T-9 through 22) **MPP-T-9** Coordinate state, regional, and local planning efforts for transportation through the Puget Sound Regional Council to develop and operate a highly efficient, multimodal system that supports the regional growth strategy. **MPP-T-10** Promote coordination among transportation providers and local governments to ensure that joint- and mixed-use developments are designed in a way that improves overall mobility and accessibility to and within such development. **MPP-T-11** Prioritize investments in transportation facilities and services in the urban growth area that support compact, pedestrian- and transit-oriented densities and development. **MPP-T-12** Give regional funding priority to transportation improvements that serve regional growth centers and regional manufacturing and industrial centers. **MPP-T-13** Make transportation investments that improve economic and living conditions so that industries and skilled workers continue to be retained and attracted to the region. Context and Design **MPP-T-20** Design transportation facilities to fit within the context of the built or natural environments in which they are located. **MPP-T-21** Apply urban design principles in transportation programs and projects for regional growth centers and high capacity transit station areas. **MPP-T-22** Implement transportation programs and projects in ways that prevent or minimize negative impacts to low income, minority, and special needs populations.	The East Link Project would act as a catalyst for mixed-use development (commercial, office, and residential) in designated urban growth areas and would focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. The East Link Project would be fast, efficient, and reliable transportation system that would provide an alternative to the SOV and would also provide linkages to other travel modes including rail, buses, and walking. East Link would provide connections among urban centers on the Eastside as well as those in adjacent communities served by the Central and North links.
Goal: The region will invest in transportation systems that offer greater options, mobility, and access in support of the regional growth strategy. **MPP-T-23** Emphasize transportation investments that provide and encourage alternatives to SOV travel and increase travel options, especially to and within centers and along corridors connecting centers. **MPP-T-24** Increase the proportion of trips made by transportation modes that are alternatives to driving alone. **MPP-T-25** Ensure mobility choices for people with special transportation needs, including persons with disabilities, the elderly, the young, and low-income populations. **MPP-T-26** Strategically expand capacity and increase efficiency of the transportation system to move goods, services, and people to and within the urban growth area. Focus on investments that produce the greatest net benefits to people and minimize the environmental impacts of transportation. **MPP-T-29** Promote the preservation of existing rights-of-way for future high-capacity transit.	The East Link Project would provide a transportation alternative to SOV for persons, including those with special needs. The East Link Project would efficiently move large numbers of people, increase the capacity of existing facilities, and promote more walkable and cohesive neighborhoods. East Link would provide connections to the other urban centers in the corridor, as well as regional destinations. After completion of the environmental review process, Sound Transit will be able to preserve right-of-way for future light rail service.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	**Discussion**
ENVIRONMENT	
Goal: The overall quality of the region's air will be better than it is today. **MPP-En-17** Maintain or do better than existing standards for carbon monoxide, ozone, and particulates. **MPP-En-18** Reduce levels for air toxics, fine particulates, and greenhouse gases. **MPP-En-19** Continue efforts to reduce pollutants from transportation activities, including through the use of cleaner fuels and vehicles and increasing alternatives to driving alone, as well as design and land use.	The East Link Project would further regional polices related to reducing dependence on SOVs and increasing nonmotorized travel modes, especially within urban centers. The East Link Project would reduce air pollution and conserve energy. Many of the stations would be located in areas designated for increased density, and East Link would provide direct and frequent access to other centers in the project corridor, as well as connections to regional destinations. Promoting transit and walkable communities would reduce vehicle miles and hours traveled and therefore would reduce air pollution.
Goal: The region will reduce its overall production of harmful elements that contribute to climate change. **MPP-En-20** Address the central Puget Sound region's contribution to climate change by, at a minimum, committing to comply with state initiatives and directives regarding climate change and the reduction of greenhouse gases. Jurisdictions and agencies should work to include an analysis of climate change impacts when conducting an environmental review process under the State Environmental Policy Act. **MPP-En-21** Reduce the rate of energy use per capita, both in building use and in transportation activities. **MPP-En-22** Pursue the development of energy management technology as part of meeting the region’s energy needs. **MPP-En-23** Reduce greenhouse gases by expanding the use of conservation and alternative energy sources and by reducing vehicle miles traveled by increasing alternatives to driving alone.	See the above goal. East Link would be powered by electricity. In the Puget Sound region and areas where East Link would be served, much of the power sources come from hydropower, a nonpolluting power source. The East Link Project would reduce greenhouse gases during operation by reducing vehicle miles and hours traveled. The East Link Project would further regional polices related to reducing dependence on SOVs and increasing nonmotorized travel modes, especially within urban centers
King County Countywide Planning Policies	
URBAN COMMUNITIES ELEMENT	
U-108: King County supports land use and zoning actions that promote public health by increasing opportunities for every resident to be more physically active. Land use and zoning actions include: concentrating growth into the urban area, promoting urban centers, allowing mixed-use developments, and adding pedestrian linkages.	The East Link Project would act as a catalyst for TOD where jurisdictions want it to occur within neighborhoods in Bellevue and Redmond, specifically the Bel-Red and Overlake Village neighborhoods.
U-109: King County supports the development of urban centers to meet the region's needs for housing, jobs, services, culture, and recreation, and to promote health. Strategies may include exploring opportunities for joint development or transit-oriented development, siting civic uses in mixed-use areas, and leveraging or utilizing existing county assets in urban centers.	The East Link Project would provide the opportunity for TOD within designated urban centers.
Environment	
E-305: King County should reduce automobile-related pollutant emissions through initiatives such as: a. Increased transit services, options, and alternatives; b. Ridesharing; and c. Innovative pricing programs to capture the true cost of driving.	The East Link Project would promote a reduction in automobile use by introducing a new transit alternative that could improve air quality and conserve energy.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Transportation	
T-106: King County and local cities should adopt transit-supportive road design standards, site access guidelines, and land use regulations to promote transit use, high-density development, mixed uses, and reduced parking in the Urban Growth Area. Site design should stress connectivity with adjacent neighborhoods and other land uses via transit, pedestrian and other nonmotorized facilities.	The East Link Project would provide the opportunity for TOD within designated urban centers. Jurisdictions in the East Link study area have identified areas for higher densities and a mix of uses.
T-302: King County should support local and regional growth management plans and policies. King County should work with other jurisdictions to focus new and existing services and facilities to support targeted land use concentrations identified in local comprehensive and regional plans and within the urban growth area of King County.	The East Link Project would encourage development to occur at greater densities in those areas identified in the local plans, all of which are located with the urban growth area of King County.
T-304: HCT facilities and services that are consistent with, and supportive of, the comprehensive plan should be supported and implemented.	The East Link Project is consistent and supportive of comprehensive plans for the cities in which the project would be located.
City of Seattle Comprehensive Plan	
LAND USE ELEMENT	
LU12: Promote a residential development pattern consistent with the urban village strategy, with increased availability of housing at densities that promote walking and transit use near employment concentrations, residential services, and amenities.	The Rainier Station location complements the multifamily residential development pattern by promoting walking and transit use.
TRANSPORTATION ELEMENT	
Increasing Transportation Choices	
TG8: Meet the current and future mobility needs of residents, businesses, and visitors with a balanced transportation system.	The East Link Project would provide an alternative to SOV travel and maintain mobility and provide fast, efficient, and reliable connections to urban centers. East Link also would encourage increased density and a mixture of land uses, which promotes transit and more walkable communities.
TG9: Provide programs and services to promote transit, bicycling, walking, and carpooling to help reduce car use and SOV trips.	Same as above.
Making Transit a Real Choice	
TG14: Increase transit ridership, and thereby reduce use of SOVs to reduce environmental degradation and the societal costs associated with their use.	The East Link Project would provide an alternative means of transportation over the SOV and would improve air quality and conserve energy.
T20: Work with transit providers to provide transit service that is fast, frequent, and reliable between urban centers and urban villages and that is accessible to most of the city's residences and businesses. Pursue strategies that make transit safe, secure, comfortable, and affordable.	The East Link Project would be designed to maximize safety, as well as provide fast and reliable transit access between urban centers and regional destinations.
T21: Support development of an integrated, regional HCT system that links urban centers within the city and the region.	The East Link Project would connect with the Central Link and North Link projects, providing links to urban centers and regional destinations.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Improving the Environment	
TG22: Reduce or mitigate air, water, and noise pollution from motor vehicles.	The East Link Project would reduce air, water, and noise pollution from motor vehicles by providing people with another mode of travel over SOVs.
Connecting to the Region	
TG24: Actively engage other agencies to assure that regional projects and programs affecting the city are consistent with City plans, policies, and priorities.	Sound Transit would coordinate and work with the City to make the East Link Project consistent.
T58: Coordinate with regional, state, and federal agencies, local governments, and transit providers when planning and operating transportation facilities and services in order to promote regional mobility for people and goods and the urban center approach to growth management.	Sound Transit would coordinate and work with the City to make the East Link Project consistent.
Neighborhood Planning	
CA-P14: Facilitate access to employment centers for Central Area residents who use public transit. Maintain efficiency of direct transit service to downtown, improve north-south transit service to regional job centers, and improve access to Eastside transit service.	East Link light rail would provide direct transit service to downtown and provide connections to regional job centers as well as improve access across Lake Washington to the Eastside cities.
City of Mercer Island Comprehensive Plan	
LAND USE ELEMENT	
1.1: A mixed-use core should be located adjacent to a regional transit facility and be of sufficient size and intensity to create a focus for Mercer Island.	The East Link Project includes a station adjacent to the mixed-use Town Center and provides connections to regional destinations.
1.2: To create opportunities for housing, multimodal transportation, and development consistent with the city's share of regional needs.	The East Link Project would provide a transportation mode that promotes increased density and allows Mercer Island to more effectively meet regional needs.
TRANSPORTATION ELEMENT	
4.1 The City of Mercer Island will continue to work with King County Metro during the update of its Six-Year Plan; the City will also work with Sound Transit and other transit providers during the creation and amendment of their long-range system plans to develop adequate transit services to meet the needs of the Island, including: • Maintain and encourage public transit service on the Island; • Provide convenient transit connections to regional activity centers, including the Seattle Central Business District, Bellevue, the University of Washington and other centers; • Convenient transit service for travel on Mercer Island; and • Potential new services including demand-responsive transit for the general public, subscription bus, custom bus services, or school buses on a space available basis.	The East Link Project would provide a fast, efficient, and reliable mode of transit connecting urban centers and providing connections to regional activity centers.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
8.1: The I-90 Memorandum of Agreement was amended in 2004. Any future modification to such access for Mercer Island traffic must comply with the terms and conditions of the MOA, as amended, and must properly mitigate the impacts of any reduction in Mercer Island traffic mobility and capacity, as set forth in Resolution 1337.	Policy 8.1 refers to the MA I-90 of 1976 (Amended in 2004), which directs the agencies (King County, City of Bellevue, City of Seattle, City of Mercer Island, Washington State Transportation Commission, and Sound Transit) to provide HCT in the center lanes of I-90 between Bellevue and Seattle as quickly as possible. East Link would provide a fast, efficient, and reliable mode of transit connecting these two urban centers.
8.3: The City of Mercer Island will work with King County Metro and Sound Transit to ensure adequate levels of transit service linking Mercer Island to the rest of the region.	Sound Transit has been communicating and working with the City of Mercer Island and will continue to do so throughout the process.
City of Bellevue Comprehensive Plan	
LAND USE ELEMENT	
Goal: To develop and maintain a land use pattern that: • Protects natural systems and helps realize the vision of a “City in a Park;” • Maintains and strengthens the vitality, quality, and character of Bellevue’s residential neighborhoods; • Supports the downtown urban center and a variety of other commercial areas serving the city and the larger region; • Supports and is supported by a variety of mobility options; • Is aesthetically pleasing; and • Makes efficient use of urban land.	One element of this goal requires that the vitality, quality, and character of Bellevue’s residential neighborhoods be maintained and strengthened; this element, however, cannot be read in isolation to the exclusion of supporting the downtown urban center, supporting a variety of mobility options, and achieving other elements of the goal. The East Link Project would promote mixed-use development in designated urban growth areas and focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods and protecting those areas where growth is not encouraged. East Link would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as regional destinations.
Growth Management	
LU-3: Accommodate growth targets of 10,117 additional households and 40,000 additional jobs for the 2001- 2022 period. These targets represent the city’s commitment to develop the zoning and infrastructure to accommodate this level of growth; they are not a commitment that the market will deliver these numbers.	The East Link Project would support more intensive development to accommodate the level of growth in areas where stations are located and where zoning allows for such development to occur.
Land Use Compatibility	
LU–9: Maintain compatible use and design with the surrounding built environment when considering new development or redevelopment within an already developed area.	The East Link Project would be located within or adjacent to existing transportation corridors and not bisect any neighborhoods. The East Link Project would act as a catalyst for growth in those areas where the city has targeted growth and would not change zoning and maintain compatibility with surrounding uses. Design of the stations would include context-sensitive design.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Other Citywide Policies	
LU-15: Encourage dedication of open space and preservation and restoration of trees and vegetation to perpetuate Bellevue's park-like setting and enhance the city's natural environment	The East Link Project would minimize the impacts and would mitigate for any impacts. Where trees and vegetation are removed, native plants and trees would be included as mitigation where applicable.
LU-16: Promote a variety of techniques to preserve open space and key natural features, such as sensitive site planning, conservation easements, and open space taxation.	The East Link Project would minimize the impacts and would mitigate for any impacts in sensitive areas or open spaces and in some areas would result in the removal or invasive species and restoration, including replanting with native plants.
Residential/ Neighborhood Areas	
LU-19: Maintain stability and improve the vitality of residential neighborhoods through adherence to, and enforcement of, the city's land use regulations	The East Link Project alternatives would travel along the boundaries of residential neighborhoods but would not bisect residential neighborhoods. Some project alternatives would acquire residential properties and/or have other potential operational or construction impacts along the edge of residential neighborhoods in Segments B and C. These impacts can be mitigated or minimized and would not result in adverse impacts on the overall quality or cohesion of these residential neighborhoods. Light rail stations near residential neighborhoods would provide a benefit to these areas in terms of improved access to transit.
LU-22: Protect residential areas from the impacts of nonresidential uses of a scale not appropriate to the neighborhood.	Same as above.
Other Commercial Areas	
LU-28: Support Downtown's development as an Urban Center, maintaining it as the financial, retail, and business hub of the Eastside.	The East Link Project would act as a catalyst for development where growth is targeted, including Downtown Bellevue. All Segment C alternatives include a station at or near the existing Bellevue Transit Center. Alternatives C7E and C14E include stations farther east and therefore may not be as consistent as the other alternatives.
TRANSPORTATION ELEMENT	
Goal: To maintain and enhance mobility for residents and businesses through the creation and maintenance of a balanced system of transportation alternatives that: • Provides a wide range of travel choices; • Supports the land use vision of the city; • Protects our neighborhoods from adverse transportation impacts; • Reflects the regional role of the city in transportation issues; and • Reduces the overall dependency on automobiles throughout the city.	The East Link Project would reduce dependency on the automobile by providing a fast, efficient, and reliable mode of transit with linkages to other modes, and also support development in those areas targeted for growth. East Link also supports the land use vision for Bellevue, including the downtown neighborhood. Alternative D5 does not include any stations in the Bel-Red Subarea and would not be as consistent with the goal of supporting the land use vision of the city.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Transportation and Land Use	
Goals: 1. To implement a fully multimodal transportation system that supports the land use vision of the Comprehensive Plan and the role of Downtown Bellevue as the Eastside urban center. 2. To reduce the use of SOVs by creating a land use pattern that allows for shorter vehicular trips and the use of alternative travel options.	Same as above.
TR-1: Integrate land use and transportation decisions to ensure that the transportation system supports the Comprehensive Plan Land Use vision.	Same as above.
TR-2: Work actively and cooperatively with other Eastside jurisdictions and regional and state agencies to plan, design, fund and construct regional transportation projects that carry out the city's transportation and land use goals.	Sound Transit has been working and will continue to work with the jurisdictions along the East Link Project corridor as well as regional and state agencies to address transportation and land use goals.
TR-3: Support the Urban Centers growth strategy of the Countywide Planning Policies by directing growth to Urban Centers and the areas with existing infrastructure capacity.	The East Link Project would act as a catalyst towards growth around the stations in the Urban Centers, where zoning is in place to accommodate this growth, including Downtown Bellevue. Alternatives C7E and C14E would be somewhat less consistent because the Bellevue Transit Center Station is located farther east away from the downtown core.
TR-4: Ensure that downtown Bellevue, the major urban center of the Eastside, includes the following: 1. Intensity/density of land uses sufficient to support HCT; 2. Mixed uses for both day and night activities; 3. Pedestrian emphasis; and 4. Alternatives to SOVs.	The East Link Project would provide an alternative to SOVs and support the increased density currently existing and that planned for construction. The increased density with the addition of light rail promotes a more walkable neighborhood. Alternatives C7E and C14E would be somewhat less consistent because the Bellevue Transit Center Station is located farther east away from the downtown core.
TR-8: Incorporate transit-supportive and pedestrian-friendly design features in new development through the development review process.	The East Link Project supports TOD in station areas that allow for increased density and would also increase the walkability of the surrounding area.
Mobility Management	
Goals: 1. To provide multiple travel options for transit users, pedestrians, bicyclists, and rideshare users, as well as the drivers of private vehicles. 2. To ensure that all members of the community, including those transportation disadvantaged, have viable travel options.	The East Link Project would provide a fast, efficient, and reliable mode of transit that would provide linkages to other transit options and would be designed to provide all members of the communities with access to the stations and trains.
TR-26: Address the special needs of citizens with various degrees of mobility in planning, designing, implementing and maintaining transportation improvements and other transportation facilities, and in delivering transportation services and programs.	Same as above.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-29: Develop the transportation system in a manner that supports the regional land use and transportation vision presented in *VISION 2020, Destination 2030*, and the Countywide Planning policies for King County.	The East Link Project would further the regional policies related to reducing dependence on SOVs and increasing nonmotorized travel modes, especially within urban centers, and related to increased density within urban centers. Alternative D5 would be less consistent with the recently adopted Bel-Red Subarea Plan because there would be no stations in the Bel-Red area.
TR-50: Work with transit providers to implement the Bellevue Transit Plan as an attractive travel option for local residents, employees, students, visitors, businesses and other users of regional facilities.	Sound Transit has been working and will continue to work with Bellevue on the East Link Project corridor to ensure East Link is an attractive travel option for residents.
TR-56: Develop partnerships with transit providers to implement projects providing neighborhood–to–transit links that improve pedestrian and bicycle access to transit services and facilities.	Same as above.
Regional Transit	
Goals: 1. To provide a regional transit service at levels that support the land use goals of the city. 2. To provide high-performance transit connections with the other urban centers in the region. 3. To develop programs to encourage ridership on regional transit.	The East Link Project would provide fast, reliable, and efficient transit service to the City of Bellevue and connections to the other urban centers in the corridor and other urban communities, as well as regional destinations. East Link also supports the land use goals by encouraging higher density and mixed-use development.
TR-59: Provide regional leadership for regional transit system planning efforts.	Sound Transit and the City of Bellevue have been coordinating through the East Link Project planning phase and will continue to coordinate through the entire project.
TR-62: Work to ensure that the regional transit system includes park-and- ride lots to serve activity centers in the region and on the Eastside to: 1. Intercept trips by single occupant vehicles closer to the trip origins; 2. Reduce traffic congestion; and 3. Reduce total vehicle miles traveled.	The East Link Project includes either the expansion of or addition of park-and-ride lots at some stations. Parking spaces would vary between the various lots, ranging from approximately 300 spaces to close to 1,400 spaces. Park-and-ride facilities needs are evaluated based on transit ridership models and are consistent with Sound Transit's Long-Range Plan to develop an HCT that supports the urban centers though which it passes.
TR-70: Promote transit use and achieve land use objectives through transit system planning that includes consideration of: 1. Land uses that support transit, including mixed-use and night-time activities; 2. Transit-oriented development opportunities with the private and public sectors; 3. A safe and accessible pedestrian environment, with restrictions on auto access; 4. Integrating multiple access modes, including buses, carpools and vanpools, bicycles, and pedestrians; 5. Urban design and community character that support and facilitate transit use; and 6. Protecting nearby neighborhoods from undesirable impacts.	The East Link Project supports mixed-use development in designated urban growth areas and helps focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. Light rail stations are designed to integrate access from other modes. Stations are designed to fit in neighborhood and facilitate transit use consistent with Light Rail Best Practices policies. East Link operational impacts on neighborhoods, as analyzed in the Final EIS, are mitigated. Alternative D5 would be less consistent with the policy because the alternative does not include any stations in the Bel-Red Subarea where Bellevue has targeted growth and higher densities.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-71: Improve transit connections between downtown Bellevue and other designated urban centers.	The East Link Project would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as regional destinations.
High-Capacity Transit	
TR-73: Work with Sound Transit to ensure that any HCT service to and within the Eastside serves Downtown Bellevue as the major hub of the Eastside.	The East Link Project would provide HCT service to Downtown Bellevue as well as other urban centers along the East Link Project corridor and adjacent centers associated with the Central Link and North Link projects.
TR-74: Work with Sound Transit to ensure that HCT services to Downtown Bellevue are provided at levels commensurate with Downtown Bellevue being the highest concentration of population and employment in King County outside of Seattle and its designation as an urban center as well as a Metropolitan Regional Growth Center. HCT services should include frequent service to downtown Seattle and other urban centers.	Same as above.
TR-75: Strengthen Bellevue's role as the Eastside urban center through provision of high levels of HCT service.	Same as above.
Light Rail Transit	
TR-75.1: Develop a light rail system in collaboration with the regional transit provider that advances the City's long-term transportation and land use objectives, minimizes environmental and neighborhood impacts, and balances regional system performance.	The East Link Project Final EIS analyzes impacts on the environment and neighborhoods and provides mitigation for significant impacts. The East Link Project contributes to a balanced regional transit system to key urban centers.
TR-75.2: Use the Light Rail Best Practices Report, including City expectations of Sound Transit, to guide City actions and advocacy in pursuit of the best community outcomes for developing and operating light rail transit in Bellevue.	East Link Project design would include input from the local jurisdictions. Sound Transit and the City of Bellevue have been coordinating through the East Link Project planning phase and will continue to coordinate through the entire project.
TR-75.3: Develop and maintain a strong working relationship with the regional transit provider to ensure a collaborative effort to implement light rail in Bellevue.	Sound Transit and the City of Bellevue have been coordinating through the East Link Project planning phase and will continue to coordinate through the entire project.
TR-75.4: Provide ample opportunity for meaningful public involvement by residents, neighborhood groups, business leaders, and other informal and formal stakeholders in a cooperative and coordinated community involvement program with the regional transit provider. Members of the community should have opportunities throughout any light rail planning and implementation process to help shape the ultimate configuration of any light rail system in Bellevue and throughout the Eastside.	Sound Transit has provided extensive opportunities for public involvement (see Appendix B) throughout the East Link Project planning phase and will continue public outreach through the entire project.
TR-75.5: Work with the regional transit provider to provide reliable, high-performance, attractive alternatives to SOV travel by providing service to the city's major employment centers and residential areas. A light rail system should add new travel capacity within its own right-of-way, rather than replace existing travel lane capacity, in order to maximize speed and reliability for light rail while minimizing impacts to other modes.	The East Link Project is a high-capacity transit alternative to the SOV and would provide fast, reliable, and efficient connections to the other regional urban centers in the corridor and other urban communities, as well as regional destinations. East Link also supports the land use goals for higher density and mixed-use development, and uses dedicated right-of-way to ensure reliability and maximize speeds when possible.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-75.6: Support plans by the regional transit provider to connect Bellevue, Seattle and Redmond activity centers, including downtown Bellevue and the developing center of Bel-Red, with service that optimizes convenience for riders. Light rail should connect "somewhere to somewhere."	The East Link Project would provide fast, reliable, and efficient connections to the regional urban centers in the corridor and other urban communities, as well as regional destinations. Alternative D5 would connect Bellevue, Seattle, and Redmond but would not fully serve the Bel-Red Subarea and therefore is less consistent with this policy.
TR-75.7: Advocate for light rail service that is consistent with local land use and transportation plans. Light rail planning should further the achievement of the City's land use and transportation vision.	East Link Project alternatives and station locations were chosen for proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans. Alternative D5 does not include stations in the Bel-Red Subarea and therefore is less consistent with this policy
TR-75.8: Advocate for an alignment for downtown Bellevue that advances the adopted land use vision for an urban downtown by: 1. Optimizing ridership, system performance, and user convenience; 2. Locating stations in proximity (i.e. within a 10 minute walk) to existing and planned employment and residential concentrations in the downtown subarea; 3. Addressing aesthetic concerns and promoting superior urban design integration, within the established urban context; 4. Minimizing impacts on businesses and residents during construction; and 5. Minimizing overall impacts of a light rail system on the operation of the downtown street network.	Station locations were chosen for proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans and optimum ridership potential. The Final EIS evaluates how East Link will perform with land use and transportation systems to minimize disruption and, where necessary, includes mitigation measures to further reduce impacts on adjacent properties during construction. Sound Transit would continue to work with the City and residents during planning and design of the East Link Project to ensure the design of the stations best reflects the character of the surrounding area. Alternatives C7E and C14E would be somewhat less consistent because the Bellevue Transit Center station is located farther east away from the downtown core.
TR-75.9: Advocate for an alignment south of downtown Bellevue that advances the adopted land use vision by: 1. Protecting the character and livability of existing neighborhoods, including adequate ingress and egress to the neighborhood; 2. Minimizing impacts to wetlands and other natural resources; 3. Providing local access to the system for Bellevue neighborhoods; and 4. Optimizing ridership and user convenience.	East Link would preserve adequate ingress and egresses to the neighborhoods. Sound Transit has enacted avoidance and minimization measures for wetlands and other natural resource areas; where impacts cannot be avoided, mitigation is proposed. Each station is designed to encourage pedestrian and nonmotorized accessibility.
TR-75.10: Advocate for an alignment in the Bel-Red corridor that is consistent with the Bel-Red Subarea Plan.	All Segment D Alternatives except Alternative D5 are consistent with the Bel-Red Subarea. Alternative D5 would not be as effective in the development of TODs at 120th and 130th areas of Bel-Red Corridor because there are no associated stations at those locations.
TR-75.11: Protect environmentally sensitive areas of local and regional significance in the siting and alignment of light rail facilities.	The Final EIS evaluates impacts on environmentally sensitive areas from operation and construction of the East Link Project. Sound Transit has enacted avoidance and minimization measures and will continue to do so throughout project development. Where impacts cannot be avoided, mitigation is proposed.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-75.12: Partner with the regional transit provider to design transit stations and facilities incorporating neighborhood objectives and context sensitive design to better integrate facilities into the community. This includes, but is not limited to the following: 1. Incorporating superior urban design, complementary building materials, and public art; and 2. Providing substantial landscaping at stations and along the alignment, including retained significant trees and transplanted trees that are, at a minimum, saplings.	Sound Transit has and would continue to work with the City and residents during planning and design of the East Link Project to ensure the design of the stations best reflects the character of the surrounding area, including landscaping and compatible building materials, and art elements. Numerous outreach opportunities have occurred, and Sound Transit will continue to provide outreach.
TR-75.13: Encourage the regional transit provider to work closely with affected neighborhoods (e.g. through neighborhood workshops, design charrettes, advisory committees) in the design of any light rail transit facility to ensure that the design of the facility incorporates neighborhood objectives and context sensitive design.	Same as above.
TR-75.14: Promote the use of context sensitive design and high quality materials to prevent and mitigate negative impacts and incorporate the light rail system appropriately into the streetscape.	Same as above.
TR-75.15: Formulate standards and guidelines that can be applied by the regional transit provider to create stations that are a valued place in the community by providing: 1. Access and linkages to the surrounding community; 2. A comfortable place to be, not just pass through; 3. A place that works for both large and small numbers of people; and 4. Design that encourages social interaction among people.	Same as above.
TR-75.16: Work with neighborhood groups, business owners, other stakeholders, and the regional transit provider to identify and fund additional improvements that can be constructed efficiently in conjunction with project construction.	Sound Transit would coordinate with the city on identified improvement projects in accordance with Sound Transit policy. A number of public involvement opportunities have occurred where the public were able to attend and provided their input on the project.
TR-75.17: Protect Bellevue's residential and commercial areas from the negative effects of light rail by promoting actions of the regional transit provider that minimize environmental, traffic and noise impacts.	The Final EIS outlines the avoidance, minimization, and mitigation measures for potential environmental, traffic, and noise impacts associated with the operation and construction of East Link.
TR-75.18: Protect residential neighborhoods adjacent to light rail facilities from spillover impacts, including parking and cut through traffic, resulting from system construction and/or operation, with techniques such as residential parking zone programs, parking patrols, and traffic calming measures. Monitor the outcomes of these efforts and make adjustments as needed to ensure continued effectiveness.	In neighborhoods where parking does not currently have restrictions, Sound Transit would work with the applicable jurisdictions to implement prevention strategies (i.e., time limits or neighborhood permit programs) where appropriate.
TR-75.19: Ensure that any future land use that occurs around station areas is consistent with the Comprehensive Plan land use vision for that area, recognizing that: 1. Some potential station areas (e.g. Bel-Red) could support more intense redevelopment that includes density increases that support transit; 2. Some potential station areas (e.g. Downtown) could sustain a more transit supportive design and orientation without changes to land use intensity; and 3. Land use changes would be precluded in existing single family designations and environmentally sensitive areas (e.g. south Bellevue, Mercer Slough).	Land use changes are regulated by jurisdictions and East Link Project alternatives and station locations were chosen for proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans. Alternative D5 would be less consistent because there are no stations in the Bel-Red Subarea that could support more intense development.
TR-75.20: Maintain and enhance the safety of Bellevue's streets when incorporating light rail, through the use of street design features, materials, street signage and lane markings that provide clear, unambiguous direction to drivers, pedestrians, and bicyclists.	The East Link Project would be designed with integration into the pedestrian-friendly environment with context-sensitive design considerations. Drop-off designation areas are planned at proposed station locations and bicycle racks are planned where appropriate. Signage and wayfinding designs for each mode would be developed with input from affected jurisdictions.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-75.21: Maximize the efficient usage of the transportation network through utilization of transit signal priority (TSP) technology. Provide for efficient light rail operation and minimize delay, while maintaining capacity for nonrail vehicle movements.	Chapter 3 and the Transportation Technical Report (Appendix H1) of the Final EIS describe where transit signal priority technology would be integrated into the planning and design of East Link Project alternatives.
TR-75.22: Encourage quality design and construction in the light rail system, by: 1. Including durable materials in design and construction to ensure facilities retain appearance, functionality and community value; and 2. Incorporating art, public spaces, and other features as community assets.	East Link Project facilities would be designed with durable materials and consistent with community character. Sound Transit implements an art in public spaces program into their facility design. East Link Project design would incorporate input from affected jurisdictions.
TR-75.23: Coordinate with the regional transit provider to employ crime prevention principles in the design of light rail stations, and use available technologies to deter crime. Examples include: 1. Visibility of station platform from adjacent streets and parking; 2. Open and well-lighted pedestrian connections to parking and adjacent community; 3. Video surveillance on station platforms and trains; and 4. Establishing and enforcing a fare paid zone for station platforms.	Sound Transit implements CPTED design principles directed at reducing crime incidents at stations and park-and-ride lots. Other measures to minimize crime would include the use of equipment (i.e., closed-circuit TV, sealed fare boxes, and automatically sealed exits), the use of anti-crime programs such as anti-graffiti programs, and the use of security personnel.
TR-75.24: Develop agreements with the regional transit provider to ensure long-term safety and security, operation and maintenance of stations.	Sound Transit contracts security personnel, operation and maintenance of their systems.
TR-75.25: Develop and maintain a safe and convenient pedestrian network to light rail stations, through shared responsibility with the regional transit provider, that is intended to: 1. Provide short, direct routes within a ten-minute walk; 2. Incorporate principles of universal design, i.e. designing the pedestrian environment to be usable by all people, to the greatest extent possible, without adaptation; 3. Maximize safety for all pedestrians at street crossings; and 4. Give priority to pedestrian access and safety in station areas.	The Final EIS evaluates existing and future pedestrian and bicycle access to ensure that safe connections would be maintained or integrated into East Link Station design.
TR-75.26: Employ principles of universal design (i.e. designing the pedestrian environment to be usable by all people, to the greatest extent possible, without adaptation) in streets within station planning areas to accommodate the widest range of potential users, including people with mobility and visual impairments and other special needs.	Station designs consider all joining modes—pedestrian; passenger drop-off; transit transfers; bicycles; and, when possible and needed, park-and-ride facilities. Sound Transit complies with ADA design requirements.
TR-75.27: Provide reliable access to the system for Bellevue residents in cooperation with local and regional transit providers, by ensuring that adequate existing and new park and ride lot capacity, neighborhood bus connections and local and regional express bus services are available.	Park-and-ride facility needs are evaluated based on transit ridership models and are consistent with Sound Transits Long-Range Plan to develop an HCT that supports the urban centers through which it passes. Sound Transit would work closely with local bus service providers to integrate bus service and planning for adequate bus transfers at East Link Station locations.
TR-75.28: Facilitate intermodal transfers and increased access to transit stations through partnerships with public and private providers of transit and shuttle services. Encourage transit-to-transit, transit-to-pedestrian, transit-to-bicycle, and transit-to-pick-up/drop-off transfers, with an emphasis on safety for people transferring between the station platform and the various modes.	Stations have been located at existing transit centers, based on input from King County Metro and other transit agencies, to optimize other transit and nonmotorized travel opportunities.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-75.29: Develop and implement an integrated wayfinding system, incorporating principles of universal design (i.e. designing the pedestrian environment to be usable by all people, to the greatest extent possible, without adaptation) and multiple languages, in conjunction with the regional transit providers, to facilitate transit ridership by all users.	Sound Transit has a signage program to facilitate user-friendly understanding.
TR-75.30: Evaluate proposed new park and ride facilities and expansion of existing park and ride facilities to serve light rail transit, for their effectiveness to serve the community and the light rail system, and for their potential environmental and community impacts. New or expanded park and ride facilities should be consistent with the Comprehensive Plan vision for each specific location.	Park-and-ride facilities needs are evaluated based on transit ridership models and are consistent with Sound Transit's Long Range Plan to develop an HCT that supports the urban centers through which it passes. The Final EIS includes information on environmental and community impacts, including Transportation; Ecosystems Resources; Parkland and Open Space; and Social Impacts, Community Facilities, and Neighborhoods.
TR-75.31: Develop an interlocal agreement with the regional transit provider to develop, monitor, and adapt mitigation measures for the design and construction phases of projects, to ensure the continual effectiveness of the measures.	A mitigation monitoring plan would be developed to monitor implementation of mitigation measures.
TR-75.32: Collaborate with the regional transit provider to create a Construction Management Plan for all new major transit investments. The Construction Management Plan should include a Construction Phasing Plan that minimizes the corridor length disrupted at one time and minimizes the time period of disruption.	A construction management plan would be developed with opportunities for input from affected jurisdictions.
TR-75.33: Place a priority on the use of noise avoidance or absorption techniques over noise deflection for residential uses when developing mitigation measures with the regional transit provider. Monitor the outcomes of these efforts and pursue adjustments with the regional transit provider to ensure continued effectiveness.	Sound Transit's noise policy is committed to minimizing noise levels at the source. In addition, Sound Transit has committed to a maintenance program that includes periodic rail grinding or replacement, wheel truing or replacement, vehicle maintenance, and operator training, which help to maintain low noise levels along transit corridors.
TR-75.34: Develop and implement an early and ongoing program with the regional transit provider to provide assistance to residents and businesses affected by construction.	Sound Transit would develop and begin implementing a Construction Outreach Program prior to commencing construction.
TR-75.35: Minimize disruption and inconvenience of construction staging areas to adjacent land uses, in collaboration with the regional transit provider, through actions such as site selection, design and operational management plans. Construction staging areas should not be located in residential neighborhoods except where no practicable alternative exists.	Proposed staging areas have been sited to minimize disturbance as practicable.
TR-77: Consider pedestrians and bicycles along with other travel modes in all aspects of developing the transportation system.	The Final EIS evaluates existing and future pedestrian and bicycle access to integrate pedestrians, bicycles, and other transportation modes into the East Link Project. Proposed East Link stations include amenities and considerations of patrons needs, including weather protection, pedestrian comfort ,and safety designs. Signage and wayfinding designs would be developed in cooperation with input from affected jurisdictions.
State Highway Corridors	
TR-94: Support multimodal transportation solutions including general purpose lanes, HCT, HOV lanes, and transit and nonmotorized improvements that use the best available technologies.	The East Link Project provides HCT, a fast, reliable, and efficient mode of transportation that would provide linkages to other nonmotorized and transit options.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
TR-96: Support HCT facilities on I-90 and SR- 520, with service to Downtown Bellevue included as an integral part of each option.	The East Link Project provides service across I-90 and along the SR 520 corridor, linking Downtown Bellevue to Seattle and Redmond as well as other urban centers associated with the East Link, Central Link, and North Link projects.
Transportation, Environment, and Quality of Life	
Goal: To minimize the impacts of the transportation system on the city's environment and neighborhood quality of life.	The East Link Project would provide for an improved quality of life by providing a fast, efficient, reliable mode of transit, encouraging increased densities where allowed, and promoting more walkable and cohesive neighborhoods. The East Link Project includes mitigation and design measures that would minimize impacts on the city's environment and neighborhood quality of life.
TR-118: Mitigate air quality, noise, light/glare, and other adverse environmental impacts of proposed transportation projects on adjacent neighborhoods.	The East Link Project would include measures to avoid or mitigate adverse impacts during construction and operation.
ECONOMIC DEVELOPMENT ELEMENT	
ED-18: Encourage high quality design and urban amenities for public and private development, maintaining development standards to recognize that a quality built environment helps attract the talented workers who will sustain economic growth.	East Link Project facilities would be designed with durable materials and be consistent with community character. Sound Transit implements an art in public spaces program into their facility design. East Link Project design would incorporate input from affected jurisdictions.
ED-26: Where commercial areas are in decline, work with businesses and other stakeholders to identify corrective actions, which may include: 1. Planning for new uses and new urban forms, leading to proposals for changes to the Comprehensive Plan and zoning 2. Developing incentives and other strategies to promote re-investment 3. Targeting investments in public infrastructure that may help catalyze new private sector investment	The East Link Project supports mixed-use development in designated urban growth areas and helps focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thereby allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. Light rail stations are designed to integrate access from other modes. Alternative D5 would be less consistent with the policy because this alternative does not include any stations in the Bel-Red Subarea, where Bellevue has targeted growth and higher densities.
CAPITAL FACILITIES ELEMENT	
CF-13: Define essential public facilities consistent with the GMA, as facilities that are difficult to site or expand and that provide services to the public, or are substantially funded by the government or are contracted for by the government or are provided by private entities subject to public service obligation.	Light rail is considered an essential public facility. Essential public facilities are typically difficult to site (e.g., airports, education facilities, transportation facilities, and others). Local comprehensive plans must accommodate the siting of essential public facilities.
CF-14: Require land use decisions on essential public facilities meeting the following criteria to be made consistent with the process and criteria set forth in Policy CF-16: 1. The facility meets the GMA definition of an essential public facility at RCW 36.70A.200(1) now and as amended; or 2. The facility is on the statewide list maintained by the Office of Financial Management (ref. RCW 36.70A.200(4)) or on the countywide list of essential public facilities; and 3. The facility is not otherwise regulated by the Bellevue land use code.	As described above, the East Link Project is an essential public facility and jurisdictions are required by the GMA to accommodate light rail in their land use plans.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
CF-15: Participate in efforts to create an inter-jurisdictional approach to the siting of countywide or statewide essential public facilities with neighboring jurisdictions as encouraged by Countywide Planning Policies FW-32 (establish a countywide process for siting essential public facilities) and S-1 (consideration of alternative siting strategies). Through participation in this process, seek agreements among jurisdictions to mitigate against the disproportionate financial burden which may fall on the jurisdiction which becomes the site of a facility of a state-wide regional or county-wide nature.	Sound Transit has coordinated with the jurisdictions where East Link would be located and will continue to coordinate. The East Link Project is identified in *Transportation 2040* developed by the Puget Sound Regional Council.
CF-16: Using this interim Siting Process to site the essential public facilities described in Policy CF-14 in Bellevue. Implement this process through appropriate procedures incorporated into the Land Use Code.	Sound Transit would coordinate with the City on the siting of the East Link Project alternatives.
CF-17: After a final siting decision has been made on an essential public facility according to the process described in Policy CF-16, pursue any amenities or incentives offered by the operating agency or by state law or other rule or regulation to jurisdictions within which such EPF are located.	Sound Transit has coordinated and will continue to coordinate with the City with regards to the East Link Project and has provided opportunities for the City to provide comments. Mitigation measures have been developed for the East Link Project that would be implemented, and Sound Transit would also comply with any permit requirements during construction.
CF-18: For EPF having public safety impacts that cannot be mitigated through the process described in Policy CF-16, the city should participate in any process available to provide comments and suggested conditions to mitigate those public safety impacts to the agency, special district or organization proposing the EPF. If no such process exists, the city should encourage consideration of such comments and conditions through coordination with the agency, special district or organization proposing the EPF. A mediation process may be the appropriate means of resolving any disagreement about the appropriateness of any mitigating condition requested by the city as a result of the public safety impacts of a proposal.	Sound Transit has coordinated and will continue to coordinate with the City with regards to the East Link Project and has provided opportunities for the City to provide comments.
ENVIRONMENTAL ELEMENT	
EN-3: Minimize, and where practicable, eliminate the release of substances into the air, water, and soil that may degrade the quality of these resources or contribute to global atmospheric changes	The East Link Project would improve air quality in the region by providing an alternate mode of transportation to the automobile and contributing to a mode shift from private automobiles to transit. The project would not result in new releases of substances to water or soil during operation, and best management practices (BMPs) would be used during construction to minimize any releases of substances to water or soil.
EN-7: Promote growth management strategies that protect air, water, land, and energy resources consistent with Bellevue's role in the regional plan to contain an Urban Center.	The East Link Project would strengthen Bellevue's role as an Urban Center by increasing access choices to downtown. The East Link Project would provide an alternative to SOVs.
EN-14: Implement monitoring and adaptive management plans for critical areas mitigation projects to ensure that the intended functions are maintained or enhanced over time.	The East Link Project would comply with applicable regulations. Design of the project would minimize the impacts and would provide mitigation where impacts occur. The East Link Project would result in impacts on critical areas, and all critical area impacts would be mitigated, including replanting with noninvasive species.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
EN-27: Implement the citywide use of low impact development techniques and green building practices that provide benefits to critical areas functions	The East Link Project would comply with applicable regulations. Design of the project would minimize the impacts and would provide mitigation where impacts occur. Sound Transit's Environmental Sustainability and Management System require that low-impact operational stormwater management techniques be investigated and considered during the design process for the project.
EN-37: Reduce runoff from streets, parking lots, and other impervious surfaces and improve surface water quality by using low-impact development techniques in new development and redevelopment.	The East Link Project includes stormwater detention and treatment to address impacts related to stormwater runoff and the designed systems. Sound Transit's Environmental Sustainability and Management System require that low-impact operational stormwater management techniques be investigated and considered during the design process for the project.
EN-49: Preserve existing vegetation or provide or enhance vegetation that is compatible with the natural character of Bellevue	The East Link Project would minimize the impacts and would mitigate for any impacts in sensitive areas or open spaces, and in some areas would result in the removal of invasive species and restoration, including replanting with native plants.
EN-59: Manage aquatic habitats, including shoreline and riparian (streamside) habitats, to preserve and enhance their natural functions of providing fish and wildlife habitat and protecting water quality.	The East Link Project would minimize the impacts and would mitigate for any impacts in sensitive areas or open spaces. In some areas the project would result in the removal of invasive species and restoration, including replanting with native plants.
EN-61: Give special attention to conservation or protection measures necessary to preserve or enhance anadromous salmonids, recognizing that requirements will vary depending on the aquatic resources involved, including differing stream classification, and that additional efforts may be identified in the regional salmon recovery planning process.	The East Link Project would comply with applicable environmental regulations to preserve and enhance the natural environment
EN-88: Ensure that excessive noise does not impair the permitted land use activities in residential, commercial, and industrial land use districts	The East Link Project would provide mitigation for noise impacts on residential and other noise-sensitive land uses.
EN-89; Protect residential neighborhoods from noise levels that interfere with sleep and repose through development standards and code enforcement	The East Link Project would provide mitigation for noise impacts on residential land uses.
EN-93: Evaluate the benefit of measures designed to mitigate arterial noise, particularly noise walls, along with impacts on the pedestrian environment and neighborhood character.	The noise analysis in the Final EIS identifies the use of sound wall or building insulation to mitigate noise impacts. The analysis provides information on noise levels before and after mitigation. The visual quality analysis in the Final EIS identifies any impacts associated with the sound walls and mitigation measures.
URBAN DESIGN ELEMENT	
UD-2: Support designs for the built environment that are visually stimulating and thoughtful and which convey excellence in architecture and workmanship, and durability in building materials.	East Link Project facilities would be designed with durable materials and in consideration of community character. Sound Transit implements an art in public spaces program into their station facility design.
UD-3: Encourage a variety of site and building designs which are compatible and consistent with surrounding development and that implement the policies of this Plan.	Same as above.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
UD-7: Encourage private and institutional developers to include artists on design teams and incorporate artwork into the public areas of their projects through the use of incentives.	Sound Transit implements an art in public spaces program into their station facility design. East Link Project design would incorporate input from affected jurisdictions.
UD-9: Use site design, landscaping, and appropriate lighting to reduce the visual impact of parking lots to public areas.	East Link Project facilities would be designed with durable materials and in consideration of community character. Sound Transit implements an art in public spaces program into their station facility design.
UD-30: Ensure public places give access to sunlight, a sense of security, seating, landscaping, accessibility, and connections to surrounding uses and activities.	The design of the station areas would include CPTED principles for safety and would include other features related to seating and landscaping and would all be ADA-accessible.
UD-31: Consider the edges of public places that abut residential property for special design treatment that creates a buffer effect, but does not interfere with security or visual access.	In areas adjacent to Downtown Bellevue where East Link alternatives would acquire land, the remaining area could be designed to create a buffer area between the residential areas.
UD-32: Ensure access to sunlight in public places by avoiding building shadows during periods of the year and times of the day when outdoor activity is most prevalent.	Only the elevated alternatives would create shadows; however, in the downtown area, the elevated structure would be smaller in scale than the adjacent buildings and would add to the already existing shadows.
UD-35: Support a variety of artwork and arts activities in public places, such as parks, public buildings, and plazas.	Sound Transit implements an art in public spaces program into their station facility design. East Link Project design would incorporate input from affected jurisdictions.
UD-47: Work closely and cooperatively with the regional transit provider in the planning and design of any transit facility to ensure that the design of the facilities reflects the general character of Bellevue and the surrounding neighborhoods.	Sound Transit would continue to work with the City and residents during planning and design of the East Link Project so the design of the stations considers the character of the surrounding area.
UD-49: Design and coordinate the proximity of bike racks, wheelchair access, pedestrian amenities and other modes of transportation with transit facilities.	Sound Transit would design the stations to take into consideration pedestrian and bicyclist amenities, and all of the stations would be designed and constructed to comply with the ADA.
UD-56: Ensure that perimeter areas of major commercial and public centers use appropriate planting, lighting, and signs to blend with surrounding development and to be compatible with surrounding residential neighborhoods.	Sound Transit implements an art in public spaces program into their facility design. East Link Project design would incorporate input from affected jurisdictions. The design of the station areas would include CPTED principles for safety as well as other features related to seating and landscaping, and all stations would all be ADA-accessible.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
City of Bellevue Comprehensive Plan Volume 2: Subarea Plans and Transportation Facility Plans	
SOUTHWEST BELLEVUE SUBAREA PLAN	
Land Use	
S-SW-1: Support the existing land use patterns and densities as shown on the Land Use Plan with the maintenance of capital facilities and services.	The East Link Project would not result in any changes to the existing land use patterns and densities in southwest Bellevue. The alternatives travel along or adjacent to existing transportation corridors and do not bisect neighborhoods. The City of Bellevue determines zoning, and areas in southwest Bellevue do not allow TOD.
S-SW-2: Protect single-family residential neighborhoods from the adverse impacts of multifamily and commercial development.	Same as above.
Environmental	
S-SW-13: Retain significant vegetation during the site plan approval and construction process	The East Link Project would comply with applicable regulations. Design of the project would minimize vegetation impacts as practical.
Transportation	
S-SW-19: Provide for the aesthetic development of Bellevue Way S.E. and 112th Avenue SE, including the provision of sidewalks and bicycle lanes on both sides of the street and landscaping along the entire street so as to provide the feeling of a continuous boulevard and a gateway for Bellevue.	The East Link Project would replace any sidewalks or bicycle lanes impacted by the project. The Final EIS identifies mitigation measures to address impacts on nonmotorized facilities.
RICHARDS VALLEY SUBAREA PLAN	
General Land Use	
S-RV-1: Ensure that development and site planning comply with the Sensitive Area Regulations	The East Link Project would comply with applicable Critical Area regulations. Design of the project would minimize impacts on critical areas and provide mitigation where impacts would occur.
S-RV-2: Encourage land uses and site development that minimize the appearance of intense development	The East Link Project alternatives are adjacent to or located within existing transportation corridors. Alternative B7, which is the only alternative within Richards Valley, would be located within the former BNSF Railway corridor and include a station in an area zoned Office and Light Industrial.
Natural Determinants	
S-RV-6: Retain the remaining wetlands within the 100-year floodplain along Richards Creek, Kelsey Creek, and Mercer Slough for drainage retention and natural resource park use.	The East Link Project would not result in any impacts on wetlands within the Mercer Slough 100-year floodplain. The alternatives are located outside of the 100-year floodplain.
S-RV-7: Protect and enhance the capability of Richards Creek, Kelsey Creek, and Mercer Slough and their tributaries to support fisheries along with other water-related wildlife.	The East Link Project would not result in any impacts that would negatively affect fisheries and other water-related wildlife.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
S-RV-8: Retain and enhance existing vegetation on steep slopes, within wetland areas, and along stream corridors to control erosion and landslide hazard potential and to protect the natural drainage system.	The East Link Project would minimize vegetation removal as practical. Vegetation would be enhanced where temporarily disturbed in these sensitive areas.
DOWNTOWN SUBAREA PLAN	
General	
S-DT-4: The highest intensity development shall be located in the core of Downtown, with diminishing intensities towards the edges of Downtown	The East Link Project would act as a catalyst for development where identified and would link Downtown Bellevue with other Urban Centers in the region. The City of Bellevue regulates zoning and the types of development that would be allowed.
S-DT-10: Require design review to ensure high quality, aesthetically pleasing Downtown development.	Sound Transit has coordinated with the City of Bellevue on the stations, and the East Link Project would be designed to integrate into the pedestrian-friendly environment with context-sensitive design considerations.
Economics	
S-DT-17: Promote economic development strategies that further Downtown Bellevue as an Urban Center, consistent with regional plans	The East Link Project would provide public transportation to Downtown Bellevue, consistent with regional plans; act as a catalyst for development where identified; and link Downtown Bellevue with other Urban Centers in the region.
S-DT-18: Strengthen Downtown's role as the Eastside's major business and commercial center and as an important revenue source for the City of Bellevue.	The East Link Project would increase the ability for employees, customers, and businesses to access Downtown Bellevue by providing fast and reliable service linking Downtown Bellevue to the surrounding region.
Urban Design	
S-DT-35: Create a pedestrian environment with a sense of activity, enclosure, and protection	The East Link Project would contribute to street activity as transit riders walk between stations and destinations. The project would allow for increased densities and a mix of uses that would encourage a pedestrian environment.
S-DT-40: Enhance the appearance of all types of streets and adjoining sidewalks with street trees, landscaping, water features, pedestrian-scaled lighting, street furniture, paving treatments, medians, or other softening treatments as appropriate.	The East Link Final EIS considers the aesthetic and visual impacts of the proposed alternatives, and recommends mitigation for impacts.
S-DT-45: Continue to encourage the NE 6th Street Pedestrian Corridor as a major unifying feature for Downtown Bellevue	The East Link Project would contribute to increased pedestrians in Downtown Bellevue, including along NE 6th Street with the addition of a station at the Bellevue Transit Center. Alternatives C7E and C14E would be less consistent because the stations are located farther east of the existing transit center and the NE 6th pedestrian corridor.
S-DT-81: Develop the NE 6th Pedestrian Corridor as a unifying feature for Downtown Bellevue by siting buildings and encouraging uses that add to pedestrian movement and activity	The East Link Project would contribute to increased pedestrians in downtown, including NE 6th Street with the addition of a station at the Bellevue Transit Center. Alternatives C7E and C14E would be less consistent because the stations are located farther east of the existing transit center and the NE 6th pedestrian corridor.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
Eastside Center District	
S-DT-85: Allow uses and development intensity that is supportive of transit and day/night activity.	The East Link Project would allow for the development intensity that is supportive of both transit and day/night activity.
S-DT-86: Discourage use of the eastern portion of this District for large-scale, stand-alone transit parking. Transit parking may be appropriate if combined with other uses.	The East Link Project does not include any park-and-ride facilities in the downtown area. There are new or expanded facilities included in the project and identified in the Final EIS.
Edges and Transitions	
S-DT-125: Use lineal green open space buffers directly downtown (north of NE 12th Street between 106th Place NE and 112th NE, and in the vicinity of the southeast corner of downtown) to provide transition from downtown to surrounding residential neighborhoods.	Some alternatives in Segment C would temporarily disrupt the open space between 106th Place NE and 112th Avenue NE (McCormick Park) during construction. During operation there would be no net loss in this open space. In addition, there are other opportunities to create new green open space buffers with a number of the alternatives south of Main Street.
Transportation and Circulation	
S-DT-130: Encourage transit service providers to improve transit connections between Downtown and the city's neighborhoods	East Link would provide a fast, reliable, and efficient mode of HCT linking Downtown Bellevue to the other urban centers in the corridor and other urban communities and destinations in the region.
S-DT-131: Work with transit providers to significantly expand transit service, including express bus transit, to Downtown Bellevue to accommodate anticipated increases in ridership.	East Link would provide a fast, reliable, and efficient mode of HCT linking Downtown Bellevue to the other urban centers in the corridor and other urban communities and destinations in the region. The project would include a station at the existing Bellevue Transit Center to link with bus transit, including express bus transit.
S-DT-132: Explore ways of providing the most effective transportation services and marketing programs for trips between major retail, office, and transit facilities Downtown, as well as activity areas on the edge of Downtown such as Overlake Hospital.	The East Link Project would provide links to the Overlake and Group Health medical centers on the edge of Downtown Bellevue.
S-DT-134: Support transit ridership to Downtown Bellevue by encouraging the regional transit providers to expand Park-and-Ride capacity outside of Bellevue	The East Link Project would expand the park-and-ride lot capacity outside of Downtown Bellevue.
S-DT-135: Provide space within or near Downtown for bus layovers and other transit facilities needed to support projected levels of transit service and ridership. Layover space and other facilities, whether developed within the right-of-way or off-street, must be located and developed in a manner that minimizes impacts on residential areas, provides an active pedestrian environment and is consistent with the district character direction in this Plan.	The design of the East Link stations in or near Downtown Bellevue would include the facilities needed to support project levels of service (i.e., platform length for loading/unloading) as well as the pedestrian environment, including ADA facilities, and would be designed to minimize impacts on residential areas.
S-DT-133: Encourage transit service providers to improve transit connections between Downtown Bellevue and other designated urban centers.	The East Link Project would improve the transit connections between Downtown Bellevue and other centers in the study area, along with providing improved access to urban centers in Seattle.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
S-DT-138: Work with Sound Transit and other regional partners to develop a HCT system that connects Downtown Bellevue to other key activity centers.	East Link, a Sound Transit project, would provide a fast, reliable, and efficient mode of HCT linking Downtown Bellevue to the other urban centers in the corridor and other urban communities and destinations in the region.
S-DT-148: Minimize Downtown SOV commute trips by coordinating with the Bellevue TMA and transit agencies to provide transit and rideshare incentives, subsidies, and promotional materials to Downtown employers and employees	The East Link Project would support the reduction of SOV commute trips by providing another transit option to Downtown Bellevue. East Link would provide a fast, reliable, and efficient mode of HCT linking Downtown Bellevue to the other urban centers in the corridor and other urban communities and destinations in the region. This would support Bellevue's Transportation Demand Management program.
BEL-RED SUBAREA PLAN	
Land Use	
Goal: To develop a land use pattern that is environmentally sustainable and economically vibrant, and that creates distinctive new commercial and residential neighborhoods for the Eastside.	All East Link Project alternatives except Alternative D5 include stations in the Bel-Red neighborhood that would support TOD in the area surrounding the stations
S-BR-6: Concentrate the majority of future Bel-Red growth into a series of mixed use, pedestrian-friendly and transit-oriented development nodes, with higher density and height therein, as enabled through a land use incentive system. Within each node, provide for tiered building heights, with maximums at the center.	All East Link alternatives except D5 include stations in the Bel-Red neighborhood that would support TOD in the area surrounding the stations.
S-BR-8: Encourage mixed use development, promoting opportunities to live, work, shop, and recreate within close proximity.	All East Link alternatives except D5 include stations in the Bel-Red neighborhood that would support TOD in the area surrounding the stations.
S-BR-9: Accommodate existing light industrial uses that were legally established as of the date of this Plan's adoption, by allowing for their continued operation, expansion including site expansion outside of nodes, and re-building if destroyed. Preclude new light industrial uses from being established, and discontinued light industrial uses from being re-established, with the exception that light industrial uses of limited size (less than 20,000 square feet) are appropriate outside transit nodes and stand-alone residential areas.	The construction and operation of a maintenance facility in the Bel-Red neighborhood would not be consistent with the policy. However, policy S-BR-70 does indicate that the City of Bellevue would work with Sound Transit to determine the need for a maintenance facility in the Bel-Red neighborhood.
Urban Design	
S-BR-H2: Incorporate natural drainage practices and other opportunities to enhance the natural environment into transportation projects where appropriate, effective and feasible.	Sound Transit's Environmental Sustainability and Management System requires that low-impact operational stormwater management techniques be investigated and considered during the design process for the project. East Link proposes to improve stream habitat in several areas were crossings may affect stream habitats.
Transportation	
S-BR-51: Support the Bel-Red Subarea Land Use Plan with a multimodal transportation system consistent with Figure S-BR.2 (map of system improvements), that provides enhanced, multimodal travel connections within the Bel-Red Subarea, and to other parts of the City and region.	All East Link alternatives except D5 include stations in the Bel-Red neighborhood that would act as a catalyst for TOD in the area surrounding the stations.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
S-BR-52: Incorporate natural drainage practices and other opportunities to enhance the natural environment into transportation projects where appropriate, effective and feasible.	The East Link Project includes stormwater detention and treatment to address impacts related to stormwater runoff and the designed systems. Sound Transit's Environmental Sustainability and Management System requires that low-impact operational stormwater management techniques be investigated and considered during the design process for the project.
S-BR-55: Extend and expand NE 16th Street as a multimodal corridor that includes vehicular, high capacity transit, and nonmotorized travel modes to serve east-west trip demand across the Bel-Red area, while incorporating significant urban open spaces, and environmentally sensitive design features.	All Segment D alternatives except D5 would be located in the NE 16th Street corridor.
S-BR-67: Work with King County Metro and other transit providers to serve emerging new land uses in the Bel-Red Subarea, and to connect to and support future light rail or alternative forms of high capacity transit, including: a. Enhance conventional transit service throughout the Bel-Red Subarea; b. Provide a level and type of service that, to the extent feasible, emulates high capacity transit in future light rail station areas, as an interim measure in advance of light rail operations; and c. Provide transit feeder service from other Bellevue neighborhoods into transit oriented development nodes at future light rail stations.	Sound Transit works closely with local bus service providers to integrate bus service into the project design. East Link Project alternatives and station locations were chosen for proximity to existing and planned commercial, employment, and residential concentrations consistent with community plans. Alternative D5 would be less consistent with the policy because it does not include stations in the Bel-Red Subarea.
S-BR-68: Work with Sound Transit to realize the City's preferred light rail route, alignment and station locations, as shown in Figure S-BR.2. Support the development of light rail stations in the vicinity of Overlake Hospital Medical Center, 122nd Avenue NE/NE 16th Street, and 130th Avenue NE/NE 16th Street.	All Segment D alternatives would serve these areas, but Alternative D5 would not directly serve the planned areas of 122nd Avenue NE, NE 16th Street, and 130th Avenue NE/NE 16th Street with stations. All of the Segment C alternatives include a station near the Overlake and Group Health medical centers.
S-BR-70: Work with Sound Transit to determine the need for a future light rail maintenance facility in Bel-Red, and if needed, to locate it where compatible with planned land uses and transportation facilities and services.	The preferred location for the maintenance facility would be decided by the Sound Transit Board with input from affected jurisdictions.
Interjurisdictional Coordination	
S-BR-I77: Coordinate with state and regional transportation and transit agencies (WSDOT, Sound Transit and King County Metro) on planning and providing transportation projects and services needed to implement this Subarea Plan.	Sound Transit has been working with and will continue to work with the jurisdictions along the East Link Project corridor as well as regional and state agencies.
Eastside Transportation Program	
Transit and Ridesharing Facilities and Services	
ETP-11: Improve intra-Eastside transit service with better connections between regional and Eastside activity centers. Transit service improvements should be linked to actions designed to increase transit demand and facilitate more cost-effective service delivery; for example, increased development density (residential and employment), parking management, and other transportation demand management strategies.	The East Link Project would promote mixed-use development in designated urban growth areas and focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. East Link would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as regional destinations.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
ETP-12: Orient the most intensive levels of transit service linking the Eastside to regional activity centers such as Downtown Bellevue, Downtown Seattle, and the University District.	The East Link Project would provide a fast, reliable, and efficient mode of HCT linking Downtown Bellevue to the other urban centers in the corridor and other urban communities and destinations in the region.
High-Capacity Transit	
ETP-20: Eastside jurisdictions should actively participate in regional efforts to develop the regional HCT system	Sound Transit has been and will continue to coordinate with the cities through the regional planning process. The specific route and station locations for the light rail project will be determined by the Sound Transit Board. Eastside jurisdictions have been active participants in developing the East Link Project.
ETP-21: Confirm Eastside corridors as high priorities for implementation of the regional HCT system. Key corridors for HCT service on the Eastside include I-90, I-405, SR 520 and SR 522.	The East Link Project would operate along I-90 and SR 520 corridors.
ETP-22: Specific routes of the HCT system within these corridors, and the location of stations and other facilities, should be determined through the regional HCT planning process.	Sound Transit has been and will continue to coordinate with the cities through the regional planning process. The specific route and station locations for the light rail project will be determined by the Sound Transit Board.
ETP-23: HCT does not refer to a specific technology or vehicle, but to HOV(s), operating on an exclusive right-of-way, guideway, or track, providing express service with infrequent stops. HCT is characterized by higher speeds than conventional transit, and greater reliability. The regional HCT system could include several different travel modes selected to meet the unique needs of the different travel corridors. Specific HCT technologies for Eastside corridors should be selected according to the type and density of present and planned development.	Light rail is an HCT technology that would operate within a dedicated right-of-way, providing efficient, reliable, and fast connections to urban centers in the project corridor, as well as other urban centers in the region.
ETP-24: The regional HCT system should be integrated with the rest of the transportation system service the Eastside.	Same as above.
ETP-25: Provisions for carpool and vanpool should be maintained when planning, constructing and operating the HCT system.	The East Link Project would be located within a dedicated right-of-way and would not affect existing carpool or vanpools. The reduction of SOVs from the local roadways would benefit carpools and vanpools.
ETP-26: The regional system should focus on providing express service between regional activity centers, with convenient and supporting connections to and between Eastside activity centers.	Light rail is an HCT technology that would operate within a dedicated right-of-way to provide efficient, reliable, and fast connections to urban centers in the project corridor, as well as other urban centers in the region.
ETP-27: Identify and preserve necessary right-of-way for Eastside HCT alignments as soon as possible.	Sound Transit would acquire the necessary right-of-way when the environmental process has been completed. The East Link Project is located within or adjacent to existing transportation corridors to minimize the amount of right-of-way required.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
ETP-28: The Eastside should prepare for the transition to an HCT system by the following: a. Focusing transit service on activity centers; b. Protecting right-of-way in potential HCT alignments and station locations; c. Implementing land use changes that will support an HCT system; and d. Proceeding as quickly as possible with planning, preliminary engineering and financial strategies designed to implement an HCT system	The East Link Project would support mixed-use development in designated urban growth areas and focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, thereby allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. East Link would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as regional destinations
Land Use Planning and Transportation	
ETP-29: Develop a regional land use plan that reflects a consolidated vision of the Eastside's future growth, and provides for better integration between land development and an efficient transportation system.	Sound Transit has considered areas for the East Link Project recommended for growth and worked to connect those areas with HCT.
ETP-30: Develop and implement regional land use policies to discourage low-density sprawl, concentrate growth in activity centers, and encourage denser development to enhance cost-effective provision of public transit services.	The East Link Project would be consistent with land use policies by supporting high-density development around a number of stations where plans and polices encourage increased density and a mixture of land uses.
ETP-31: Link specific transportation facilities and services to the type and density of present and planned land development on the Eastside.	Same as above.
ETP-32: Implement land use changes that will support a HCT system, such as high- density development around station locations.	Same as above.
ETP-33: Develop design guidelines for land development to enhance public transit service to new developments	The East Link Project would support increased densities and mix of uses in those areas that have been identified for this type of growth.
ETP-34: Protect the safety of residential streets and the livability of neighborhoods by minimizing the amount of through traffic on neighborhood streets and neighborhood collectors (nonarterials) in residential areas.	The East Link alternatives are located within or adjacent to existing transportation corridors and do not bisect neighborhoods. The Final EIS provides information on neighborhood impacts associated with the various alternatives. The East Link Project would include mitigation to protect neighborhood streets from cut-through traffic to protect the livability of neighborhoods.
Public Education and Community Involvement	
ETP-45: Implement an active outreach program by ETP participants to involve community organizations, employers, residents, developers, and businesses to help solve the area's transportation problems by implementing the ETP recommendations and working toward the longer-range solutions for the Eastside.	The East Link Project has included a number of local stakeholders to provide feedback on the project and alternatives. Additionally, a number of opportunities have been provided for the public and community organizations to provide their input on the project and the project alternatives.
ETP-46: Develop and implement a comprehensive public education and community involvement program aimed at more efficient utilization of the region's transportation system, and long-term changes in travel behavior that will minimize the need for road building programs.	Same as above.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
City of Redmond Comprehensive Plan	
LAND USE ELEMENT	
LU-43: Designate Redmond's downtown and the Overlake Center as urban centers under the Countywide Planning Policies and recognize these areas as such in all relevant local, regional policy, planning and programming forums. Through plans and implementation strategies, encourage and accommodate focused office, retail, and housing growth and a broad array of complementary land uses. Also, emphasize support for transit use, pedestrians, and bicycling.	The East Link Project is evaluating stations located within both Downtown Redmond and the Overlake Center. East Link would support an increased density of mixed land uses and would emphasize transit, walking, and bicycling.
TR-25: Use transit as a way to provide for access, circulation, and mobility needs in areas planned for higher-density mixed-use development and for favorable pedestrian environments.	The East Link Project would support mixed-use development in designated urban growth areas and focus the majority of growth in station areas where existing zoning and land use codes allow for greater densities. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. East Link would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as regional destinations.
TR-29: Participate actively and continuously in the planning and development of an efficient, timely, and effective regional HCT system that is competitive with the SOV. Plan for the extension of HCT to the Eastside and to Overlake, Downtown Redmond, and SE Redmond as part of Sound Transit Phase 2, or any successor plan.	The East Link Project provides a fast, efficient, and reliable mode of transit as an alternative to SOVs, and would provide service to Overlake, Downtown Redmond, and SE Redmond as well as connections to other urban centers in the East Link corridor and the region. Sound Transit will continue to coordinate with the City of Redmond for future phases of East Link.
TR-30: Support HCT service and support facilities for Redmond that: • Provide service to Overlake, Downtown Redmond, and SE Redmond that is located to ensure efficient, timely, and effective service, within an HCT route located mainly in the SR 520 freeway corridor; • Locate HCT stations in Overlake, Downtown Redmond, and SE Redmond; • Locate the Downtown Redmond station site near the intersection of SR 202 and SR 520; and • Achieve higher bus transit service levels to and within Redmond's two urban centers, providing connections to the HCT stations.	The East Link Project provides a fast, efficient, and reliable mode of transit as an alternative to SOVs, and would provide service to Overlake, Downtown Redmond, and SE Redmond with stations located in those areas as well as connections to other urban centers in the East Link corridor and the region. Sound Transit will continue to coordinate with the City of Redmond for future phases of East Link.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
City of Redmond Neighborhood Planning Element	
OVERLAKE NEIGHBORHOOD PLAN UPDATE	
N-OV-28: Increase mobility within Overlake and provide for convenient transit, pedestrian, and bicycle routes to and from Overlake by: 1. Encouraging commuter traffic to use regional facilities such as SR 520; 2. Encouraging use of transit, car pools, bicycles, and other forms of transportation, that decrease congestion and parking demand; 3. Enhancing multimodal connections within the Overlake Neighborhood and between the neighborhood and nearby areas, including Downtown Redmond; and 4. Providing bicycle facilities, such as bicycle racks in new developments, bike lanes on key streets, and signage at key points.	The East Link Project provides a fast, efficient, and reliable mode of transit as an alternative to SOVs and would provide service to Overlake, Downtown Redmond, and SE Redmond as well as connections to other urban centers in the East Link Project corridor and the region.
N-OV-29: Strive to achieve, by 2030, a non-SOV (transit, bicycling, walking) mode split of 40% for peak-period trips in Overlake through such means as providing a pedestrian and transit supportive environment, developing supportive land uses, working with regional transit agencies to provide expanded transit options, including light rail and bus rapid transit, and implementing a parking management plan.	The East Link Project would provide a non-SOV form of transportation and would also provide opportunities for supportive land uses, and thereby would further the ability of achieving the mode split in the neighborhood.
N-OV-30: Establish Overlake as a Growth and Transportation Efficiency Center by 2010 to promote the use of alternative transportation modes in Overlake.	The East Link Project would help fulfill this goal by providing an alternative transportation mode in Overlake.
N-OV-36: Work closely with Sound Transit and other agencies to identify a preferred light rail route through Overlake Village, along such routes as 152nd Avenue NE, NE 24th Street, or others as identified through Sound Transit's East Link Light Rail planning process. Promote SR 520 as the preferred corridor leading from Overlake Village to the Employment Area and Downtown Redmond.	Sound Transit and the City of Redmond have been coordinating and working together through the East Link Project planning phase and will continue to coordinate through the entire project. SR 520 is the preferred corridor for East Link.
N-OV-37: Locate two light rail stations within the Overlake Neighborhood. Locate a light rail station in Overlake Village in the vicinity of 152nd Avenue NE and NE 24th Street. Create a dynamic and high-quality urban place through consideration of design, land use density and mix, community facilities, and public and private investments that emphasizes pedestrian activity and minimizes parking facilities. Locate a second light rail station in the Employment Area adjoining the existing Overlake Transit Center at NE 40th Street. Create a high-quality place that fits seamlessly with the character of the Employment Area, facilitates transfers between transportation modes, and encourages additional uses to be developed on the Overlake Transit Center site that are supportive of transit stations, such as housing and convenience retail or service uses.	Alternatives associated with the East Link Project include the stations located within the Overlake Neighborhood. East Link would support TOD by allowing a greater density and a mixture of land uses to occur in the station areas. The increased density would allow for more efficient use of land, allowing for an efficient provision of services and facilities as well as promoting walkable and cohesive neighborhoods. East Link would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as regional destinations.
N-OV-51: Encourage new transit-oriented development in order to take advantage of local and regional transit opportunities.	Same as above.
N-OV-59: Recognize the public benefit that can be derived from the site's proximity to the Overlake Village Transit Center, the planned bus rapid transit line, and the proposed Sound Transit light rail station by encouraging walkable, transit-supportive development through incentives tied to building height and allowable floor area.	Same as above.

TABLE F4.2-1 CONTINUED
East Link Project Consistency with Regional and Local Plans, Goals, and Policies

Policy Type and Goals	Discussion
N-OV-78: Encourage linkages between employment campuses and other parts of the neighborhood for walking, biking, transit use, and other non-SOV transportation modes through building and site design.	Same as above.
SOUTHEAST REDMOND	
N-SE-6: If funding under the regional Transportation Plan becomes available and the adopted plans provide for service to the subarea, accommodate a transit station and a maintenance facility for a regional rapid transit system that would make Redmond a primary location for transit operations. Designate a 10- to 15-acre parcel as a transit station with a park-and-ride facility, and establish NE Union Hill Road as the corridor to the maintenance facility.	The East Link Project has located a park-and-ride station within the SE Redmond neighborhood and it is also a potential area for a maintenance facility.
N-SE-7: Transit stations and terminals are desired in the subarea, subject to special development permit approval. Development of retail and services uses in combination with the transit station shall be permitted; provided, that commercial uses are designed and sited to be supportive of transit ridership. Examples of such uses include: day care facilities, newsstands and laundromats, coffee shops and pharmacies.	The East Link Project stations would support development around the stations.
N-SE-35: Interconnect a rapid transit system from regional employment and housing centers to the Redmond Central Business District/Southeast Redmond employment center.	The East Link Project would provide fast, reliable, and efficient connections to the other urban centers in the corridor and other urban communities, as well as to regional destinations.
DOWNTOWN REDMOND	
DT–11 Recognize the eastern portion of the downtown as Redmond's preferred location for a downtown multimodal HCT station that would serve and support the vision for the downtown. Work closely with Sound Transit and other agencies to promote this area as a location for an urban HCT station, and to promote SR-520 as the preferred HCT corridor serving the site. Undertake work in a timely manner to refine the preferred location and to prepare updates to policies and implementation measures. Locate the downtown station to be complementary to location of an additional station in SE Redmond that is designed to intercept vehicles from the Avondale and SR 202 corridors and to serve as the terminus for HCT service.	Sound Transit and the City of Redmond have been coordinating and working together through the East Link Project The EIS considers station and route alternatives consistent with this policy.

[a] Estimates rounded to the nearest 10.

[b] The C9T - East Main Station Design Option connecting from *Preferred Alternative B2M* would not result in a change to impacts for either *Preferred Alternative C9T* or *B2M*.

Notes:

Some alternatives will have the same station names as other alternatives but with different population, household, and employment estimates. This is because stations in some alternatives have the same names but are in somewhat different locations.

This table was created using Puget Sound Regional Council traffic analysis zone data within a half-mile of the station. In the event that the half-mile study area of more than one station area overlaps with another in the same alternative, the data were collected as a single station area to avoid overcounting overlapping station areas.

Data were tabulated to fit the study area.

Appendix F4.5

Visual Consistency and Key Observation Point Analyses

Appendix F4.5

Visual Consistency and Key Observation Point Analyses

F4.5.1 Visual Consistency with Comprehensive Plans

Sound Transit assessed the East Link Project's consistency with visual resource goals and policies of relevant local comprehensive plans and ordinances; Table F4.5-1 presents the results of the analysis. The subarea neighborhood plans listed in the table are part of the comprehensive plans of their respective cities. With the three exceptions discussed below, none of the general plans or subarea plans were found to contain specific goals and polices for aesthetic or visual resources of direct relevance to the East Link Project, but most contain guidance relative to maintaining and improving the appearance and/or character of the physical environment.

One possible exception would concern view corridor guidelines associated with the Downtown Core Design District guidelines, which were developed by the City of Bellevue in order to implement the *Downtown Subarea Comprehensive Plan* policies. The pedestrian access structure associated with the 112th NE Elevated Alternative (C7E) could intrude on views of some Cascade Mountains peaks from the east side of 110th Avenue NE, part of which has been designated as a major open space as discussed below in Table F4.5-1. The pedestrian access structure (particularly the "tent" structures) associated with the 114th NE Elevated Alternative (C14E) could also intrude on views of some Cascade Mountains peaks from part of 110th Avenue NE. The other possible exception with consistency would involve the elevated station and elevated profile of the 110th NE Elevated Alternative (C8E) as it passes over 110th Avenue NE. Alternative C8E would likely not meet the intent of the urban design element in the *Bellevue Comprehensive Plan* with respect to avoiding shadows and allowing access to sunlight in areas that receive heavy pedestrian use (as described below in Table F4.5-1, part of 110th Avenue NE has been designated as a major open space).

As design of the East Link Project progresses beyond the route selection phase, specific ordinances, regulations, and design guidelines will be reviewed to help guide final design and consistency with the development directives of the municipalities along the selected route. During the final design of the East Link Project, Sound Transit will coordinate with the various cities to, among other things, help meet relevant policies, guidelines, and requirements.

F4.5.2 Key Observation Point Analysis

This section provides site-specific descriptions of the visual impacts of the East Link Project and the alternatives on selected viewing locations. Because it is not possible to include all important viewing locations near a proposed project, representative locations—key observation points (KOPs)—were selected. KOPs are used to describe existing visual conditions and to analyze the impacts of a proposed action on visual resources.

Thirty-one KOP locations were selected for the East Link Project after the field reconnaissance of the project alternatives and meetings with the planning departments of the Cities of Bellevue and Redmond. In addition, important community features that were identified in public workshops were considered in determining KOP locations.

The impacts of the alternatives on the KOPs are described by segment in the following subsections in terms of potential changes in landscape character, visual quality categories, and impacts on sensitive viewers. Where applicable, impacts on the KOPs from shadows and light and glare are also noted in the descriptions.

The 31 KOP locations are shown on Map F4.5-1 that appears before Exhibits F4.5-1 to F4.5-31 at the end of this section. These exhibits illustrate the changes in existing views caused by the alternatives. Photographs show the existing views from the KOPs, followed by "project" simulations that depict what the alternative would look like when viewed from the KOP.

TABLE F4.5-1
Analysis of Project Consistency

Plan Goals and Policies	Consistency of East Link Project
City of Seattle Municipal Code	
Title 25 (Environmental Protection and Historic Preservation) of the City of Seattle Municipal Code (SMC) contains policies relevant to the project vicinity. Subsection P (Public View Protection) of SMC (Specific environmental policies) states that it is the City's policy to protect public views of significant natural and built features such as Mount Rainier, the downtown skyline, major bodies of water, and historic landmarks designated by the Landmarks Preservation Board. Attachment 1 of that section identifies view corridors from which public views are protected. Relevant to this project are the protected views from sections of 4th Avenue South, I-5, and I-90. Potential effects on views from these corridors must be identified during the State Environmental Policy Act (SEPA) review process.	The East Link Project would not block views of the downtown skyline, major bodies of water, and/or historic landmark from protected view corridors that include 4th Avenue South, I-5, and I-90. The project would, therefore, be consistent with the intent of Title 25 of SMC.
City of Seattle Neighborhood Plans	
The Rainier Station would be constructed in an area that falls between areas under the jurisdiction of the *North Rainier Neighborhood Plan* and the *Central Area Neighborhood Plan*. These plans do not have specific visual or aesthetic elements, but they identify the desire to maintain or improve the appearance of the two neighborhoods.	The East Link Project would add pedestrian-scale features associated with the station that would be seen from nearby (and elevated) areas, such as Judkins Park and Sam Smith Park. The station would help to slightly improve views from these areas and would be consistent with the desire to maintain or improve the appearance of the neighborhoods. Final design of this portion of the project will involve coordinating with the City of Seattle and following pertinent design guidelines and regulations.
Mercer Island Comprehensive Plan	
The *Mercer Island Comprehensive Plan* does not contain a specific visual or aesthetic element, nor does it contain aesthetic or visual resource goals that specifically apply to the East Link Project. It does, however, have goals for the Town Center Zone, which is immediately south of the I-90 corridor.	The East Link Project would be consistent with the *Mercer Island Comprehensive Plan*. Final design of the Mercer Island Station will involve coordinating with the City of Mercer Island and following pertinent design guidelines and regulations.
Bellevue Comprehensive Plan	
The *Bellevue Comprehensive Plan* does not contain a specific visual or aesthetic element, but it does include an urban design element that contains goals and policies that are relevant to visual or aesthetic issues potentially associated with the East Link Project. In particular, there is a reference within the urban design element that encourages new projects to be designed to avoid shadows and allow access to sunlight, particularly for areas that receive pedestrian use. The urban design element also encourages working closely and cooperatively with the regional transit provider in the planning and design of any transit facility to ensure that the design of the facilities reflect the general character of Bellevue and the surrounding neighborhoods. None of the subarea plans for the four Bellevue subareas through which East Link Project would pass contain specific visual or aesthetic elements. Two of the subarea plans, however, contain goals and/or policies that relate to visual or aesthetic issues relevant to the East Link Project (see below).	The elevated station and elevated profile of the 110th NE Elevated Alternative (C8E) as it passes over 110th Avenue NE would create shadows and block sunlight on sidewalks and nearby areas. The alternative would likely not meet the intent of the urban design element regarding shadows and sunlight in areas that receive pedestrian use. The portion of the elevated station and elevated profile of the 112th NE Elevated Alternative (C7E) located in Downtown Bellevue would also create shadows and block sunlight on sidewalks and nearby areas; however, this portion of 112th Avenue NE is not heavily used by pedestrians. During final design, Sound Transit will coordinate with the City of Bellevue and follow pertinent design guidelines and regulations from the *Bellevue Comprehensive Plan* and its elements identified by the City.

TABLE F4.5-1 CONTINUED
Analysis of Project Consistency

Plan Goals and Policies	Consistency of East Link Project
Southwest Bellevue Subarea Plan	
This *Southwest Bellevue Subarea Plan* has several transportation and urban design goals that can be considered to be related to visual or aesthetic issues, which can be grouped as follows: A. **Urban Design Goals.** Encourage design features such as landscaping, pedestrian amenities, and street furniture at intersections and in areas with excess right-of-way on Bellevue Way SE to establish and/or enhance residential character. B. **Transportation Goals.** Encourage aesthetic development of Bellevue Way SE as a gateway from I-90 to Main Street. Provide for sidewalks and bicycle lanes on both sides of the street and landscaping along the entire street to give the feeling of a continuous boulevard and a gateway for Bellevue for both Bellevue Way SE and 112th Avenue SE.	Project-related features, particularly those related to stations, would provide design features and pedestrian amenities that would contribute to an attractive neighborhood. By coordinating with the City of Bellevue during final design, Sound Transit will follow pertinent design guidelines and regulations identified by the City from this *Southwest Bellevue Subarea Plan*.
Bellevue Downtown Subarea Plan	
This *Bellevue Downtown Subarea Plan* contains various goals that encourage developing an aesthetically attractive downtown through various means that could be relevant to the East Link Project. Among them are differentiating downtown districts by using streetscape improvements, directional signage, and wayfinding features (which help people navigate through the Downtown).	By coordinating with the City of Bellevue during final design, Sound Transit will follow pertinent design guidelines and regulations identified by the City of Bellevue that are contained in this *Bellevue Downtown Subarea Plan*. Project-related features, particularly those related to stations, would provide design features and pedestrian amenities that would contribute an attractive pedestrian-oriented downtown.
Bellevue Downtown Core Design District	
The Downtown Core Design District includes the area bounded by 102nd Avenue NE on the west, NE 9th Street on the north, 112th Avenue NE on the east, and NE 3rd Street on the south. The purpose of the Downtown Core Design District is to implement the *Bellevue Downtown Subarea Comprehensive Plan* policies. Section 20.25A.100.E.6 of the guidelines concerns “View Preservation Corridors” and states that the purpose of the corridors is to “retain the opportunity for viewing Lake Washington, the Seattle skyline, the Olympic Mountains and the Cascade Mountains from the major public open spaces and the major pedestrian corridor.” Two of the three major public spaces (106th Avenue NE and 110th Avenue NE) in the district would have Segment C alternatives passing through them. These major open spaces are centered on the two avenues’ intersection with the major pedestrian corridor. The portion of the major pedestrian corridor that Segment C alternatives would cross is NE 6th Street. Therefore, views that are of relevance to Segment C alternatives are pedestrian views (street level) from the portions of 106th and 110th Avenues NE near their intersections with NE 6th Street and views from NE 6th Street (Including the Bellevue Transit Center). Of the views described in the guidelines, views of the Cascade Mountains are of relevance to Segment C alternatives.	Peaks of the Cascades Mountains might be seen by pedestrians in some parts of the general area near the intersection of 110th Avenue NE and NE 6th Street but not from some areas near the eastern portion of the intersection (see Appendix F4.5, Exhibit F4.5-14, Photo 14a). Hills to the east of downtown block most views of the main portion of the Cascade Mountains from street level and buildings block views to the southeast of Mount Rainier. The transition structures and elevated portions of the alignments associated with *Preferred 108th NE At-Grade Alternative (C11A)* and *Preferred 110th NE Tunnel Alternative (C9T)* that would be located in NE 6th Street would not block views of the Cascade Mountains from the 110th Avenue NE and NE 6th Street intersection area. The 112th NE Elevated Alternative (C7E) elevated pedestrian walkway might intrude on views of some Cascade Mountain peaks from limited areas around 110th Avenue NE and NE 6th Street but not from KOP 17 (see Appendix F4.5, Exhibit F4.5-17, Photo 17b). The tent structures associated with 114th NE Elevated (C14E) would block some street level views of parts of the Cascade Mountains the 110th Avenue NE and NE 6th Street intersection area (see Appendix F4.5, Exhibit F4.5-17, Photo 17c).
Bel-Red/Northup Subarea Plan	
In the *Bel-Red/Northup Subarea Plan*, there are several community design goals that stress using landscaping for transportation improvements along arterials to create a sense of identity and continuity and that require that new development plant and maintain street trees.	By coordinating with the City of Bellevue during final design, Sound Transit will follow pertinent design guidelines and regulations identified by the City of Bellevue that are contained in this subarea plan.

TABLE F4.5-1 CONTINUED
Analysis of Project Consistency

Plan Goals and Policies	Consistency of East Link Project
Redmond Comprehensive Plan	
The *Redmond Comprehensive Plan* does not contain specific visual or aesthetic elements; it does, however, have an element for Community Character and Historic Preservation that contains a subsection that addresses view corridors and other topics. Policies encourage identifying gateways into the city and unique neighborhood gateways, as well as direct that public view corridors, such as those that include the Sammamish River, be preserved and enhanced through design efforts. The *Redmond Comprehensive Plan* also includes neighborhood plans that contain guidance for issues related to visual quality (such as character and design) and other topics. In addition to the *Downtown Plan and Overlake Neighborhood Plan* discussed below, East Link Project segments would pass through parts of the Grass Lawn and Southeast Redmond neighborhoods.	By coordinating with the City of Redmond during final design, Sound Transit will follow pertinent policies, design guidelines, and regulations identified by the City that are contained in the *Redmond Comprehensive Plan* and neighborhood plans.
Redmond Downtown Plan	
The *Redmond Downtown Plan* consists of a number of different districts that together compose Downtown Redmond. The plan has an overarching Character and Design section that provides guidance relevant to issues related to character and appearance. Other districts within the downtown area also contain directives relevant to character and appearance.	By coordinating with the City of Redmond during final design, Sound Transit will follow pertinent policies, design guidelines, and regulations identified by the City of Redmond that are contained in the *Redmond Downtown Plan*.
Overlake Neighborhood Plan Update	
The *Overlake Master Plan and Implementation Strategy (Master Plan)*, as part of the *Overlake Neighborhood Plan Update* process, updates the *Redmond Comprehensive Plan* for the Overlake neighborhood. It does not contain specific visual or aesthetic resources components, but it does contain policies that address related topics such as neighborhood character. The master plan seeks to create a sense of place and a unique neighborhood character for the Overlake area and seeks to encourage improvement of the pedestrian environment.	By coordinating with the City of Redmond during final design, Sound Transit will follow pertinent design guidelines and regulations identified by the City of Redmond that are contained in this *Overlake Neighborhood Plan Update*. The East Link Project (particularly near stations) would provide design features and pedestrian amenities that would contribute an attractive pedestrian-oriented neighborhood.

F4.5.2.1 Segment A

The impacts of the *Preferred Interstate 90 Alternative (A1)* on views at KOPs 1 and 2—neither of which would be substantially affected by the East Link Project—are as follows:

- **KOP 1, looking west towards Seattle I-90 portal (Exhibit F4.5-1, Photos 1a and 1b)**. The light rail system would be seen in the center of the I-90 floating bridge. The low, linear, at-grade route would be compatible with the bridge in terms of form, line, and color, but it would not add to the bridge's apparent height when viewing it from Lake Washington or the shoreline. The light rail vehicles would be visually consistent with the transportation-oriented character of the bridge and would not change the existing medium visual quality category. Sensitive viewers (I-90 Trail users, boaters, and shoreline residents) would likely not be disturbed by the presence of East Link because it would cause little change to the appearance of the bridge. Other than the light rail vehicles, the most noticeable project components would be the overhead catenary system (OCS), but due to their rectilinear form, scale, and color, they would be similar in character to the bridge. Note that the photograph used for KOP 1 is elevated and displays more of the bridge and East Link route than would actually be seen by viewers from vehicles.
- **KOP 2, looking northeast from 80th Avenue SE on Mercer Island (Exhibit F4.5-2, Photos 2a and 2b)**. The trackway and Mercer Island Station would be clearly seen from this location but would be consistent with the existing transportation-oriented character of the I-90 retained cut and nearby elevated sidewalks. Project components such as the stations stairs, elevators, structures (shelters), and loading platforms would add human-scaled architectural

elements and human activity to what is now a vehicular dominated "freeway" and would improve visual intactness and unity. Sensitive viewers (recreationists using the parks-on-the-lid that span the retained cut) would likely find the presence of the elevators and station area to be visually neutral or somewhat of an improvement over freeway lanes. The East Link Project would not change the existing medium visual quality category.

F4.5.2.2 Segment B

Preferred 112th SE Modified Alternative (B2M)

KOPs 3, 5, 7, and 8 are located along this alternative, and following are the impacts to each:

- **KOP 3, 112th Avenue SE looking south at I-90 (Exhibit F4.5-3, Photos 3a and 3b)**. The top of the elevated guideway, the OCS, and passing trains would be seen from this location but would be consistent with the existing character of the view, which is dominated by the elevated I-90. The horizontal line and form of the guideway along with its color would be similar to that of the elevated I-90 structure. At night, lights from the light rail vehicles would be seen by sensitive viewers (i.e., residents) but would be seen less frequently than the lights of vehicles passing by on I-90. *Preferred Alternative B2M* would not change the view's existing medium visual quality category.
- **KOP 5, residence overlooking Bellevue Way SE (Exhibit F4.5-5, Photos 5a and 5b)**. Very little of *Preferred Alternative B2M* would be seen from the deck of this residence. Vegetation that currently screens some of the view to the east, including Bellevue Way SE, would continue to block most of the view of *Preferred Alternative B2M* except a possible view of the OCS. The high visual quality category of the view from this location would not be changed.
- **KOP 7, Bellevue Way SE looking northeast across the street from the front of the Winters House (Exhibit F4.5-7, Photos 7a and 7b)**. Existing mature vegetation in front of the house would be removed. Sound Transit would build a new landscaped entry on top of the portion of the lid in front of the building covering the retained cut. During the design development process, landscape plans for this area will be examined as part of the design review by the City of Bellevue. After the new entrance is established, the front of the Winters House would regain its high visual quality category.
- **KOP 8, the intersection of 112th Avenue SE and Bellevue Way SE looking north along 112th Avenue SE from Bellevue Way (Exhibit F4.5-8, Photos 8a and 8b).** The variation that is simulated is the one that would connect to *Preferred 110th NE Tunnel Alternative (C9T)*. As depicted in the simulation, the retained-cut profile of this alternative would not be readily seen from the intersection. Vegetation between the construction right-of-way and the intersection that would be retained would partially screen views of the alternative. The portion of the alternative that transitions from retained cut to at-grade north of the intersection can be seen in the simulation. The most noticeable change from this view north on 112th Avenue SE would be the removal of some large trees within the construction right-of-way. Sound Transit would replant the area between the intersection and the alignment to enhance the visual buffer of *Preferred Alternative B2M* components created by remaining vegetation. During the design development process, landscape plans for this area will be examined as part of the design review by the City of Bellevue. Removing vegetation would change the appearance of the intersection, but would not lower the area's high visual quality category to medium.

Preferred 112th SE Modified Alternative (B2M) Connecting to Preferred Alternative C11A

This portion of *Preferred Alternative B2M* route would pass KOP 9, and the impacts would be as follows:

- **KOP 9, looking northeast along 112th Avenue SE (Exhibit F4.5-9, Photos 9a and 9b).** *Preferred Alternative B2M* connecting to *Preferred 108th NE At-Grade Alternative (C11A)* would replace a series of landscaped medians with the at-grade guideway, widen the road, and remove some existing trees on both sides of 112th Avenue NE. Removing the landscaped medians would lower intactness along the route, but overall, the existing heavily landscaped boulevard-like character of this part of 112th Avenue SE would be retained, largely because of the continued existence of numerous nearby mature trees and adjacent landscaped areas. The area's high degree of vividness and unity would remain high and the existing high visual quality category would be retained.

Preferred 112th SE Modified Alternative (B2M) Connecting to Preferred Alternative C9T

This portion of the *Preferred Alternative B2M* route would pass KOP 9, and the following describe the potential visual impacts:

- **KOP 9, looking northeast along 112th Avenue SE (Exhibit F4.5-9, Photos 9a and 9c).** The portion of the *Preferred Alternative B2M* to *Preferred Alternative C9T* route would remove a series of landscaped medians and vegetation along the east side of the 112th Avenue SE but would not remove vegetation along the western side of the street. Removing the landscaped medians would lower intactness along the route, but overall, the existing boulevard-like character of the viewed landscape would be retained, largely because of the continued existence of numerous nearby mature trees and adjacent landscaped areas. The area's high degree of vividness and unity would remain high, and the existing high visual quality category would remain.

Bellevue Way Alternative (B1)

KOPs 3, 4, 5, 6, and 11 are located along the Bellevue Way Alternative (B1) route. KOP 19 would be the one KOP where the existing visual quality category would change. The impacts of Alternative B1 on these KOPs are as follows:

- **KOP 3, 112th Avenue SE looking south at I-90**. The at-grade trackway and light rail vehicles associated with this alternative would not be seen from this KOP.
- **KOP 4, looking at South Bellevue Park-and-Ride from 112th Avenue SE (Exhibit F4.5-4, Photos 4a and 4b)**. The at-grade South Bellevue Station associated with Alternative B1 as well as light rail vehicles and a parking structure would be seen from this location but would not change the "park-and-ride/arterial" character of the area near the existing South Bellevue Park-and-Ride Lot. The at-grade route, loading platforms, and structures (shelters) would add built architectural elements to the area and would be similar in form, line, and color to the existing bus stop area. Landscaping (which was not depicted in the simulation so that project components could be clearly seen) would be provided that would conform to City of Bellevue requirements and would help soften the appearance of the station area to allow it to better fit in with nearby areas. The west side of the new parking garage would be seen from this location and would add a new large-scale element to the viewed landscape. This alternative would not change the existing overall medium visual quality category of the park-and-ride lot and general area.
- **KOP 5, residence overlooking Bellevue Way SE (Exhibit F4.-5, Photos 5a and 5c)**. Alternative B1 would remove some of the trees on the slope below the deck of this residence that currently screens some of the view to the east, including Bellevue Way SE. Removing many of the trees would allow residents to see the OCS and tops of passing rail cars from some locations on the deck and would open up wider views of the blueberry fields and Mercer Slough Nature Park to the east. The portions of the project components that would be seen would not encroach on this view and seeing them would not greatly change the visual character of the viewed landscape or change the view enough to lower the view's high visual quality category to medium.
- **KOP 6, Bellevue Way SE near the Winters House looking south (Exhibit F4.5-6, Photos 6a and 6b).** Adding two lanes to the west side of Bellevue Way SE would remove trees along the bottom of the existing slope and construct a retaining wall that would reach heights of up to 28 feet. The changes would be noticeable and would replace the existing "soft" western edge of the avenue with a retaining wall that would give it a more developed character. The heavily vegetated hillside would still be a primary visual component of this view but would be less dominant than it currently is. Alternative B1 would reduce visual quality, but with retaining wall treatments (not depicted in the simulation), it would not lower visual quality enough to change the classification from high to medium. Potential mitigation measures would reduce the impacts of the retaining walls simulated in Exhibit F4.5-6b. The measures would include re-landscaping and reducing the impact of the walls using methods that could include retaining walls (or a series of smaller walls) with ornamental patterns or interesting textures. Sound Transit would re-landscape areas along the sections of Bellevue Way SE that would be removed to widen the street and construct the retaining walls. In addition, Sound Transit would coordinate with the City of Bellevue and the neighborhood during design of these alternatives. The presence of the wall would change the character of Bellevue Way SE, but would not change the character or visual quality of views towards the Winters House from the roadway.

- **KOP 11, Bellevue Way SE from SE 10th Street (Exhibit F4.5-11, Photos 11a and 11b).** Alternative B1 would widen Bellevue Way SE to the east, remove existing vegetation (and a structure), and add an at-grade guideway. The form, scale, and line of the at-grade guideway would be compatible with the road and nearby areas. Light rail vehicles would pass closely by this location and would provide new visual elements. The character of this arterial would become more intensely linked to transportation. Although some trees and vegetation would be removed, the areas adjacent to the route would remain pleasant and the alternative would not lower the area's medium visual quality category.

112th SE At-Grade Alternative (B2A)

Of the six KOPs (3, 4, 5, 6, 9 and 10) located along this alternative, the visual quality category of two (KOPs 5 and 6) would change. The 112th SE At-Grade Alternative (B2A) would have the following impacts on the six KOPs:

- **KOP 3, 112th Avenue SE looking south at I-90 (Exhibit F4.5-3, Photos 3a and 3b).** Impacts would be similar to those described for *Preferred Alternative B2M.*

- **KOP 4, looking at South Bellevue Park-and-Ride from 112th Avenue SE (Exhibit F4.5-4, Photos 4a and 4c)**. The guideway would still be elevated at this location and, along with the elevated station, would add large-scale horizontal elements to the view from this location. As explained under the Alternative B1 impact assessment for KOP 4, landscaping required by the City of Bellevue (which is not depicted in the simulation so that project components could be clearly seen) would help soften the appearance of the new facility. Although the new project components would be highly visible from this location, they would not be out of character with the existing transportation facility character of the park-and-ride lot. The elevated structures would be memorable and would not reduce intactness or unity enough to lower the overall visual quality category from medium to low.

- **KOP 5, residence overlooking Bellevue Way SE looking east (Exhibit F4.5-5, Photos 5a and 5d)**. Alternative B2A would have a greater impact than Alternative B1 because the project components of B2A would be more visible. At this location, the profile of the alternative would transition from elevated to at-grade, and the guideway would still be above grade at this location. Residents would see the OCS and passing light rail vehicles below them as well as the east side of Bellevue Way SE (which is currently screened by vegetation). Removal of the trees would also open up views to the east of blueberry fields and Mercer Slough Nature Park. The project components would somewhat change the visual character of the viewed landscape by adding views of transportation elements (the guideway and clearer views of Bellevue Way SE), which would lower vividness and unity ratings from high to medium and lower the existing high visual quality category to medium. It should be noted that the residence selected for this viewpoint is one of the closest hillside residences to Bellevue Way SE. Other residences located farther away from the alternative would have less direct views of the project components due to distance and the screening effect of vegetation.

- **KOP 6, Bellevue Way SE near the Winters House looking south (Exhibit F4.5-6, Photos 6a and 6c).** The portion of the retaining wall that would be seen from this location would somewhat change the character of Bellevue Way SE, but would not change the high visual quality category. It would not change the character or visual quality of views towards the Winters House from the roadway. Some of the potential mitigation measures discussed for Alternative B1 could be incorporated for this alternative.

- **KOP 9, looking northeast along 112th Avenue SE (Exhibit F4.5-9, Photos 9a and 9b).** Alternative B2A would replace a series of landscaped medians with the at-grade guideway, widen the road, and remove some existing trees. Removing the landscaped medians would lower intactness along the route, but overall, the existing boulevard-like character of the viewed landscape would be retained, largely because of the continued existence of numerous nearby mature trees and adjacent landscaped areas. The area's high degree of vividness and unity would remain high and the existing high visual quality category would remain.

- **KOP 10, 112th Avenue SE looking north near SE 8th Street (Exhibit F4.5-10, Photos 10a and 10b).** The view from this location would include the at-grade station as well as part of the retained cut that leads to the tunnel portal. Expanding 112th Avenue SE to the east and west would remove a number of existing trees and other adjacent roadside vegetation. The at-grade station and retained-cut structure would be pedestrian in scale and would increase the view's vividness.

Although existing trees would be removed and the part of the street near just north of the station (but south of Surrey Downs Park) widened, Alternative B2A would not lower the view's medium visual quality classification enough to reclassify it as low.

112th SE Elevated Alternative (B2E)

The visual quality category of KOPs 5 and 6 among the six KOPs located along the 112th SE Elevated Alternative (B2E) (KOPs 3, 4, 5, 6, 9 and 10) would change from high to medium under this alternative. The impacts of Alternative B2E would be as follows:

- **KOP 3, 112th Avenue SE looking south at I-90 (Exhibit F4.5-3, Photos 3a and 3b).** Impacts would be similar to those described for *Preferred Alternative B2M.*
- **KOP 4, looking at South Bellevue Park-and-Ride Lot from 112th Avenue SE (Exhibit F4.5-4, Photos 4a and 4c).** Impacts would be the same as described for Alternative B2A.
- **KOP 5, residence overlooking Bellevue Way SE (Exhibit F4.5-5, Photos 5a and 5e)**. The elevated structure, OCS, and passing light rail vehicles would be clearly seen. Seeing these project components would add a transportation element into the view of the blueberry fields, which would change the visual character of the viewed landscape. The project components would lower the existing high vividness and unity and lower the visual quality category to medium. It should be noted that the residence selected for this viewpoint is one of the hillside residences closest to Bellevue Way SE. At night, lights from the light rail vehicles would be seen from some residences. Other residences located farther from the alternative would have less direct views of the project components due to distance and vegetative screening.
- **KOP 6, Looking south along Bellevue Way SE near Winters House (Exhibit F4.5-6, Photos 6a and 6d).** Alternative B2E would add a large-scale elevated element to the view from this location; it would contrast in color, form, color, and texture with the vegetated hillside. Construction would remove existing trees and other vegetation along on the adjacent hillside. Alternative B2E would change the existing visual quality category from high to medium. Sound Transit would re-landscape areas under the sections of hillside that would be altered to construct the elevated structure. In addition, Sound Transit would coordinate with the City of Bellevue during alternative design. The presence of the elevated structure would change the character of Bellevue Way SE but would not change the character or visual quality of views towards the Winters House from the roadway.
- **KOP 9, looking northeast along 112th Avenue SE (Exhibit F4.5-9, Photos 9a and 9d)**. Alternative B2E would generally retain the existing boulevard-like character of 112th Avenue SE and would retain trees along the left side of the view that would be removed with Alternative B2A as a result of widening 112th Avenue SE. Alternative B2E would introduce a large-scale elevated transportation element into the viewed landscape. The elevated guideway would follow the curve of the road and be visually associated with it. The guideway would also contribute to visual vividness and unity of the area along the road in this view. The alternative would not change the existing high visual quality category of this view.
- **KOP 10, 112th Avenue SE looking north near SE 8th Street (Exhibit F4.5-10, Photos 10a and 10c).** The elevated station and structure would remove trees and vegetation along the east side of 112th Avenue SE and would block views of remaining trees and the nearby office building parking lot. The scale, form, line, and color of the elevated station and structure would greatly change the character of this portion of 112th Avenue SE and would lower visual quality of the area seen from this location. However, it would not lower visual quality enough to reclassify the area's medium visual quality category to low.

112th SE Bypass Alternative (B3)

The 112th SE Bypass Alternative (B3) passes through KOPs 3, 4, 5, 6, 9, and 10. Impacts to these KOPs for Alternative B3 would be as follows:

- **KOP 3, 112th Avenue SE looking south at I-90 (Exhibit F4.5-3, Photos 3a and 3b).** Impacts would be similar to those described for *Preferred Alternative B2M.*
- **KOP 4, looking at South Bellevue Park-and-Ride Lot from 112th Avenue SE (Exhibit F4.5-4, Photos 4a and 4c).** Impacts would be same as those described for Alternative B2A.
- **KOP 5, residence overlooking Bellevue Way SE (Exhibit F4.5-5, Photos 5a and 5d)**. Impacts would be same as those described for Alternative B2A.
- **KOP 6, Looking south along Bellevue Way SE near the Winters House (Exhibit F4.5-6, Photos 6a and 6c).** The retaining wall that would be

constructed into the hillside would not extend as far south along Bellevue Way SE as it would with Alternative B1. Alternative B3 would be very similar in appearance to Alternative B2A from this location and would not lower visual quality enough to change the category from high to medium.

- **KOP 9, looking northeast along 112th Avenue SE (Exhibit F4.5-9, Photos 9a and 9b)**. Impacts would be same as those described for Alternative B2A.
- **KOP 10, 112th Avenue SE looking north near SE 8th Street (Exhibit F4.5-10, Photos 10a and 10d).** North of the intersection of SE 8th Street and 112th Avenue SE, Alternative B3 leaves 112th Avenue SE and transitions from at-grade to an elevated structure, as depicted in the simulation. Its route passes through parking lots and undeveloped areas and near office buildings and would minimize the removal of large trees along 112th Avenue SE. The presence of the elevated profile would be consistent with the nearby structures, including I-405, and would change the medium visual quality category of the area through which it passes.

BNSF Alternative (B7)

The BNSF Alternative (B7) would have negligible impacts on the three KOPs (3, 12, and 13) located along its route. Alternative B7 would have the following impacts on these KOPs:

- **KOP 3, 112th Avenue SE looking south at I-90 (Exhibit F4.5-3, Photos 3a and 3b).** Impacts would be the same as described for Alternative B2A.
- **KOP 12, looking west along the I-90 (Mountains to Sound) Trail where it passes through the Mercer Slough Nature Park (Exhibit F4.5-12, Photos 12a and 12b).** The elevated structure would be noticeable to trail users from this location and would introduce a second large-scale structural element into the view. In terms of form, line, and color, the elevated profile would be similar to this section of I-90 but not as massive in terms of scale. Although not depicted in Photos 12a and 12b, much of the trail passes immediately next to trees and large shrubs. Other areas of the trail are more open, with areas of trees and large shrubs being as far as 100 feet away (to the north) from the trail. The vegetation greatly reduces the amount of Mercer Slough Nature Park that can be seen from most parts of the trail and blocks views to the north. The elevated structure depicted in the simulation in Photo 12b would be seen from the more open parts of the trail but would be screened by adjacent vegetation along other parts of the trail. The openings between the columns would allow views beyond the structure (although nearby vegetation would block most views north of the route). While the presence of the elevated structure would impact visual quality, the impact would not be great enough to lower the visual quality category from medium to low.
- **KOP 13, looking south along 118th Avenue SE (Exhibit F4.5-13, Photos 13a and 13b).** The elevated guideway passing over 118th Avenue SE and part of the 118th Station would be visible from this location. The presence of these project components, however, would be consistent with the character of this area, which is heavily influenced by I-405 (which is just to the left and out of view of Photos 13a and 13b). The design of the station and at-grade streetscape features, as well as the removal of several existing buildings, would improve vividness and unity. The presence of the elevated structure and station would slightly improve visual quality but not enough to change the visual quality category from low to medium.

F4.5.2.3 Segment C

Preferred 108th NE At-Grade Alternative (C11A)

Preferred Alternative C11A would pass near three KOPs (14, 15, and 18) but would not change the visual quality categories of any of the KOPs. *Preferred Alternative C11A* would have the following impacts on these KOPs:

- **KOP 14, looking north along 112th Avenue from its intersection with SE 6th Street towards Surrey Downs Park (Exhibit F4.5-14, Photos 14a and b).** *Preferred Alternative C11A* would be located to the west of 112th Avenue SE at the location depicted in the simulation. Vegetation adjacent to 112th Avenue SE within Surrey Downs Park would be removed and a retaining wall constructed into the slope next to the at-grade alignment. Although vegetation within the park would be removed, the viewed landscape from this location would still contain considerable vegetation and would retain a park-like character. The retaining wall could introduce a hard edge to the park, but it would be designed to reduce its impact by using methods that could include ornamental patterns or interesting textures. The design of this area and the retaining wall would be reviewed by the City of Bellevue. The medium visual quality category of this portion of 112th Avenue SE would not be changed.

- **KOP 15, looking west along Main Street from east of its intersection with 112th Avenue SE (Exhibit F4.5-15, Photos 15a and b).** *Preferred Alternative C11A* would introduce an elevated structure, traction-powered substation (TPSS) facility, and new landscaping along this part of Main Street. The light rail would change the area's character by replacing existing residential-scale buildings with the elevated structure. Although removing existing trees and residences along the south side of Main Street would lower the visual quality of this portion of Main Street, it would not change enough to lower the existing visual quality category of medium to low. Replaced landscaping in this area would serve as a buffer between Surrey Downs residences and the trackway as well as function as a transition area between the neighborhood and Downtown Bellevue.
- **KOP 18, looking west along NE 6th Street from 112th Avenue NE (Exhibit F4.5-18, Photos 18a and 18b).** From this KOP, the transition structure and elevated guideway would clearly be seen. Together these features would add a new, large-scale visual element to this area. The line and form of the structures would be somewhat similar to the line and form of the Meydenbauer Conference Center. The structures would add vivid and memorable elements to the view. The transition structure east of the tunnel portal would block some views to the south towards the Bellevue City Hall area from the sidewalk near the Meydenbauer Conference Center and its garage entrance. The alternative would not change the existing medium visual quality of the nearby area.

Preferred 110th NE Tunnel Alternative (C9T)

Preferred Alternative C9T would pass near two KOPs (15 and 18), where it would change the appearance of the existing setting but have negligible impacts. The visual impacts of *Preferred Alternative C9T* would be as follows:

- **KOP 15, looking west along Main Street from east of the 112th Avenue SE intersection (Exhibit F4.5-15, Photos 15a and 15c)**. *Preferred Alternative C9T* would change the appearance of this part of Main Street by replacing existing residential-scale buildings and established vegetation with a retained-cut and portal transition structure and adjacent landscaping. The landscaping would serve as a buffer between Surrey Downs residences and the trackway as well as function as a transition area between the neighborhood and Downtown Bellevue. In terms of line, scale, and form, the structure would not be out of character with this part of Main Street. *Preferred Alternative C9T* would somewhat diminish the visual quality of this area but not enough to change the visual quality category from medium to low.
- **KOP 18, looking along NE 6th Street from 112th Avenue NE (Exhibit F4.5-18, Photos 18a and 18c).** The transition structure and elevated guideway would be clearly seen from this location. The transition structure would be located farther east compared with *Preferred Alternative C9T,* and the elevated structure would be slightly lower as it passes over 112th Avenue SE. The alternative would not change the existing medium visual quality of the nearby area.

Bellevue Way Tunnel Alternative (C1T)

The Bellevue Way Tunnel Alternative (C1T) would pass by KOP 18 and would have negligible impacts:

- **KOP 18, looking west along NE 6th Street from 112th Avenue NE (Exhibit F4.5-18, Photos 18a and 18d).** Impacts would be the same as with *Preferred Alternative C9T*.

106th NE Tunnel Alternative (C2T)

The 106th NE Tunnel Alternative (C2T) would pass by two KOPs (15 and 18) and would have the following, negligible impacts:

- **KOP 15, looking west along Main Street from east of the 112th Avenue SE intersection (Exhibit F4.5-15, Photos 15a and 15d).** Alternative C2T would change the appearance of this part of Main Street by replacing existing residential-scale buildings and established vegetation with a retained-fill portal transition structure and adjacent landscaping. In terms of line, scale, and form, the structure would not be out of character with this part of Main Street. Although Alternative C2T would diminish the visual quality of the area, it would not diminish it enough to change the visual quality category from medium to low.
- **KOP 18, looking along NE 6th Street from 112th Avenue NE (Exhibit F4.5-18, Photos 18a and 18d).** Impacts would be the same as with *Preferred Alternative C9T*.

108th NE Tunnel Alternative (C3T)

The visual quality category of the two KOPs (15 and 21) located along the 108th NE Tunnel Alternative (C3T) would not change in the long term. Alternative C3T would have the following impacts on these KOPs:

- **KOP 15, looking west along Main Street from east of the 112th Avenue NE intersection (Exhibit F4.5-15, Photos 15a and 15d)**. Impacts would be the same as described for Alternative C2T.

- **KOP 21, looking east along NE 12th Street near intersection with 110th Avenue NE (Exhibit F4.5-21, Photos 21a and 21b)**. Alternative C3T would greatly change the existing appearance of McCormick Park as seen from this location by removing established trees and other landscape features and replacing them with a transition structure and elevated structure over I-405. The loss of the vegetation would reduce the vividness of these views and lower visual quality from high to medium. From this location, vegetation would eventually be seen behind the transition structure as part of a redesigned and replanted McCormick Park. Photo 21b depicts what a park might look like (there are no plans yet) shortly after the park is reestablished.

Couplet Alternative (C4A)

The visual quality of the three KOPs (15, 16, and 21) located along the Couplet Alternative (C4A) would not be lowered by this alternative. The impacts on these KOPs would be as follows:

- **KOP 15, looking west along Main Street from east of 112th Avenue NE intersection (Exhibit F4.5-15, Photos 15a and 15b)**. When viewed from this location, Alternative C4A would have an appearance similar to *Preferred Alternative C11A*.
- **KOP 16, looking south along 110th Avenue NE from north of Bellevue City Hall (Exhibit F4.5-16, Photos 16a and 16b)**. The at-grade route and station as seen from this location would be similar in scale and design with nearby streetscape elements and would fit in with the urban character and pedestrian orientation of the area around 110th Avenue NE. The high visual quality of the view from this location would not change, and many pedestrians (who have high viewer sensitivity) would likely find that the project components would add visual vividness and help further unify the streetscape.
- **KOP 21, looking east along NE 12th Street near intersection with 110th Avenue NE (Exhibit F4.5-21, Photos 21a and 21c)**. This alternative would greatly change the existing appearance of the part of McCormick Park east of 110th Avenue NE by removing established trees and other landscaping features and replacing them with guideway on a retained-fill structure in the transition to an elevated profile, as illustrated in Photo 21c. Removing the trees would reduce the vividness of this view and visual quality would be lowered from high to medium. From this location, vegetation would eventually be seen behind the transition structure as part of a redesigned and replanted McCormick Park. Photo 21c depicts what a park might look like (there are no plans yet) shortly after it is reestablished.

112th NE Elevated Alternative (C7E)

The 112th NE Elevated Alternative (C7E) would pass by two KOPs (17 and 20) and would have negligible impacts. The impacts of Alternative C7E on KOPs 17 and 20 would be as follows:

- **KOP 17, looking east along NE 6th Street from 110th Avenue NE (Exhibit F4.5-17, Photos 17a and 17b).** From this location, the elevated guideway along 112th Avenue NE and the elevated walkway connecting to Bellevue City Hall would clearly be seen. These structures would be consistent with the existing character of nearby areas and would add vivid and memorable elements to the view. From this location on 110th Avenue NE and NE 6th Street, the elevated walkway would not block views of Cascade Mountains peaks. Sensitive viewers (e.g., pedestrians) would probably not be affected by the structures, and some would likely enjoy the elevated views that would be available from the elevated walkway and station. Alternative C7E would be consistent with the medium visual quality of the viewed area.
- **KOP 20, looking southeast along 112th Avenue NE from an elevated view from the west side of 112th Avenue NE (Exhibit F4.5-20, Photos 20a and 20b).** From this location approximately one and half stories above the sidewalk, the elevated structure associated with Alternative C7E would be seen as would the nearby I-405 and various overpasses and other streets. The presence of the elevated structure and the OCS would be very noticeable to residents and customers in this building, particularly those on the second and third floors. At night, lights from the light rail vehicles would be seen by residents. The presence of the elevated structure and OCS, however, would not reduce the medium visual quality of this part of 112th Avenue NE to low.

110th NE Elevated Alternative (C8E)

The visual quality of three KOPs (16, 19, and 21) located along the 110th NE Elevated Alternative (C8E) route would be changed from high to medium. Alternative C8E would have the following impacts on these KOPs:

- **KOP 16, looking south along 110th Avenue NE north of Bellevue City Hall (Exhibit F4.5-16, Photos 16a and 16c)**. The elevated station and profile would be supported by straddlebents that extend across the width of the street. Although this part of Downtown Bellevue is surrounded by medium- and highrise buildings, the East Link Project's components would be out of scale when viewed from the street and nearby City Hall plaza. The station (and to a lesser degree the elevated profile) would create shadows at times along parts of the sidewalk and street below. Alternative C8E would lower visual quality from high to medium and would likely result in a negative reaction by many of the area's sensitive viewers (e.g., pedestrians).
- **KOP 19, looking northeast along 110th Avenue NE from south of NE 8th Street (Exhibit F4.5-19, Photos 19a and 19b).** From this sidewalk corner the elevated structure of Alternative C8E would be clearly seen. The structure would cross over NE 8th Street and in front of several mixed-use buildings with four stories of multifamily units. Although the this area's setting is very urban, the elevated structure would introduce a large-scale element near midrise residences. The elevated profile would add some shadowing to the street and sidewalks below at certain times of the day. Of more concern would be the presence of the elevated structure and moving trains (and lights at night) that would be seen from the windows and balconies of nearby residents. The high visual quality of this portion of 110th Avenue NE would be reduced to medium.
- **KOP 21, looking east along NE 12th Street near intersection with 110th Avenue NE (Exhibit F4.5-21, Photos 21a and 21d)**. As illustrated in Photo 21d, the presence of the straddlebents and the elevated profile associated with this alternative would introduce elements that would be out of scale with the existing view from this location. The impact of the view from this intersection would reduce the visual quality category from high to medium.

114th Avenue NE Elevated Alternative (C14E)

The 114th NE Elevated Alternative (C14E) would pass by KOP 17, and its visual impacts would be as follows:

- **KOP 17, looking east along NE 6th Street from 112th Avenue NE (Exhibit F4.5-17, Photos 17a and 17c).** This KOP would provide a view of Alternative C14E's elevated profile, elevated station, and pedestrian bridge that provide connection between 112th Avenue NE and the station as well as possible tent structures and a pedestrian bridge. These structures would be consistent with the existing character of nearby areas and would add vivid and memorable elements to the view. Views of the Cascade Mountains are not visible from this location (even on clear days), so blocking mountain views would not be an issue. Sensitive viewers (e.g., pedestrians) would probably not be affected by the structures, and some would likely enjoy elevated views from the pedestrian bridge. The tent structures might intrude on views between the Meydenbauer Conference Center and Bellevue City Hall. Alternative C14E would be consistent with the medium visual quality of the viewed area.

F4.5.2.4 Segment D

Preferred NE 16th At-Grade Alternative (D2A)

The *Preferred NE 16th At-Grade Alternative (D2A)* would pass by two KOPs (24 and 25) and have negligible impacts. The impacts of this alternative on KOPs 24 and 25 would be as follows:

- **KOP 24, looking southwest along 152nd Avenue SE at the Overlake Village Station (Exhibit F4.5-24, Photos 24a and 24b).** From this location the existing trees along the west side of 152nd Avenue NE that would be removed for the station and alignment as part of D2A – NE 24th Design Option can be clearly seen. The tree removal would be noticed and would be a negative impact, but the presence of other trees in the general area (behind the station area) and new trees that would be planted, would help temper their loss. The pedestrian scale of the at-grade station is consistent with area in which it would be located. The station, at-grade profile, and removal of the trees would somewhat lower the visual quality of this area, but not enough to lower the existing medium visual quality to low.
- **KOP 25, looking southeast over SR 520 towards Overlake Village Station (Exhibit F4.5-25, Photos 25a and 25b).** From this location from an office building parking lot next to the SR 520 Bicycle Trail and across the freeway from the station site, the station would be clearly seen. Trees and other vegetation along the edge of the existing business park as well as buildings would be removed. The station and alignment would be consistent with the transportation, scale, form, and character of SR 520. The presence of the station would slightly improve the visual quality of the area it would be

built in but not enough to raise it from low to medium.

NE 16th Elevated Alternative (D2E)

The NE 16th Elevated Alternative (D2E) would pass by one KOP (23) and would have negligible impacts. The impacts of these alternatives on KOP 23 would be as follows:

- **KOP 23, looking west along NE 24th Street from near intersection with 151st Avenue NE (Exhibit F4.5-23, Photos 23a and 23b).** The elevated portions of Alternative D2E would transition to at-grade along NE 24th Street and would be clearly seen from this location. Existing street trees and a building would be removed in order to construct the elevated and at-grade profiles along this section of NE 24th Street. Although the elevated structures would be noticeable from this location and would add another transportation element to the view, the removal of existing street trees would be the most noticeable part of the alternatives. After construction is complete and street trees replaced, the visual quality would be lower but not enough to reduce the visual quality category from medium to low.

F4.5.2.5 Segment E

Preferred Marymoor Alternative (E2)

The *Preferred Marymoor Alternative (E2)* would pass by one KOP (26) and would have negligible impacts. The impacts of this alternative on KOP 26 would be as follows:

- **KOP 26, looking northwest from Marymoor Park sports fields (Exhibit F4.5-26, Photos 26a and 26b).** The *Preferred Alternative E2* elevated structure would be visible from parts of Marymoor Park as it transitions to grade just north of the sports fields, but most of the route that passes by the park would be at-grade and parts of it would be screened by vegetation. It would be similar to SR 520 in terms of line, form, color, and scale. Sensitive viewers (e.g., recreationists) would not likely find the presence of the guideway and light rail vehicles adjacent to SR 520 visually disturbing. *Preferred Alternative E2* would not lower the existing high visual quality of this area.

Redmond Way Alternative (E1)

One (KOP 29) of the three KOPs (27, 28, and 29) located along the Redmond Way Alternative (E1) would be substantially affected. Alternative E1 would have the following impacts on these KOPs:

- **KOP 27, looking east from a multifamily complex overlooking West Lake Sammamish Drive (Exhibit F4.5-27, Photos 27a and 27b).** From this ground-level location, the elevated structure and light rail vehicles would be approximately at eye level. Many trees located on the slope between this complex and West Lake Sammamish Drive would be removed. The elevated structure would introduce a large-scale horizontal element to eastern views from this complex (although many views are blocked by existing vegetation that would be removed). At night, lights from the light rail vehicles would be seen. Visual quality would be temporarily reduced from medium to low. Within 5 to 10 years replanted vegetation could screen the view of the elevated structures from these residences if were trees were planted close enough to the residences. This would, over time, improve the low visual quality category to medium.
- **KOP 28, looking northwest along West Lake Sammamish Parkway NE (Exhibit F4.5-28, Photos 28a and 28b).** From this location, the elevated structure would generally parallel West Lake Sammamish Parkway NE along the bottom of a vegetated hillside above a small commercial strip development and below a condominium development. The structure would be noticeable from this location, but would not be greatly out of character with the existing arterial-road character of this part of West Lake Sammamish Parkway NE. The elevated structure would introduce a large-scale horizontal element high above the nearby street and would be seen from the condominium complex above. The existing visual quality of the section of West Lake Sammamish Parkway NE would be reduced from medium to low. When replanted trees would began to mature and somewhat screen the elevated structure, the visual quality category would increase to medium.
- **KOP 29, looking north along Sammamish River Trail near Luke McRedmond Landing Park at the NE Redmond Way overpass (Exhibit F4.5-29, Photos 29a and 29b)**. The elevated guideway would be apparent from this location as it descends in front of the NE Redmond Way bridge to connect at-grade with the raised former BNSF Railway bed (to the east of the simulation shown in Exhibit F4.5-29, Photo 29b). The elevated structure would add a large-scale element to this view, but due to the presence of the NE Redmond Way overpass, it would not be appear greatly out of place in terms of form, materials, and color. The removal of some trees could be noticed by some

park and trail users. The elevated structure would be compatible with existing visual character and would not lower the areas high visual quality category.

Leary Way Alternative (E4)

The Leary Way Alternative (E4) would pass by two KOPs (30 and 31) and change the existing visual quality category of KOP 30 from high to medium. Alternative E4 would have the following impacts on KOPs:

- **KOP 30, looking east from the north side of Leary Way NE towards the Leary Way NE bridge over the Sammamish River, the River Walk Condominiums, and the entry into Downtown Redmond (Exhibit F4.5-30, Photos 30a and 30b).** Constructing the elevated structure associated with Alternative E4 would remove existing street trees located along the south side of Leary Way NE and next to a condominium. Removing the trees and constructing the elevated structure would reduce the high visual quality of this area to medium.

- **KOP 31, looking east towards Downtown Redmond from Leary Way NE near the intersection with 159th Place (Exhibit F4.5-31, Photos 31a and 31b).** From this location, the end of the transition structure between the elevated and at-grade portions of the alternative can be seen. Construction would remove a row of maple trees along with some nearby Douglas fir trees and other vegetation. Potential mitigation measures (as viewed in this visual simulation) that would be coordinated with the City of Redmond include planting another row of deciduous street trees along the sidewalk to create a vegetative pattern that would be similar to the existing pattern and planting shrubs next to the transition structure to help reduce the contrast of the walls with the nearby vegetation. The project would somewhat change the visual character and quality, but would not change visual quality enough to lower the existing high category to medium.

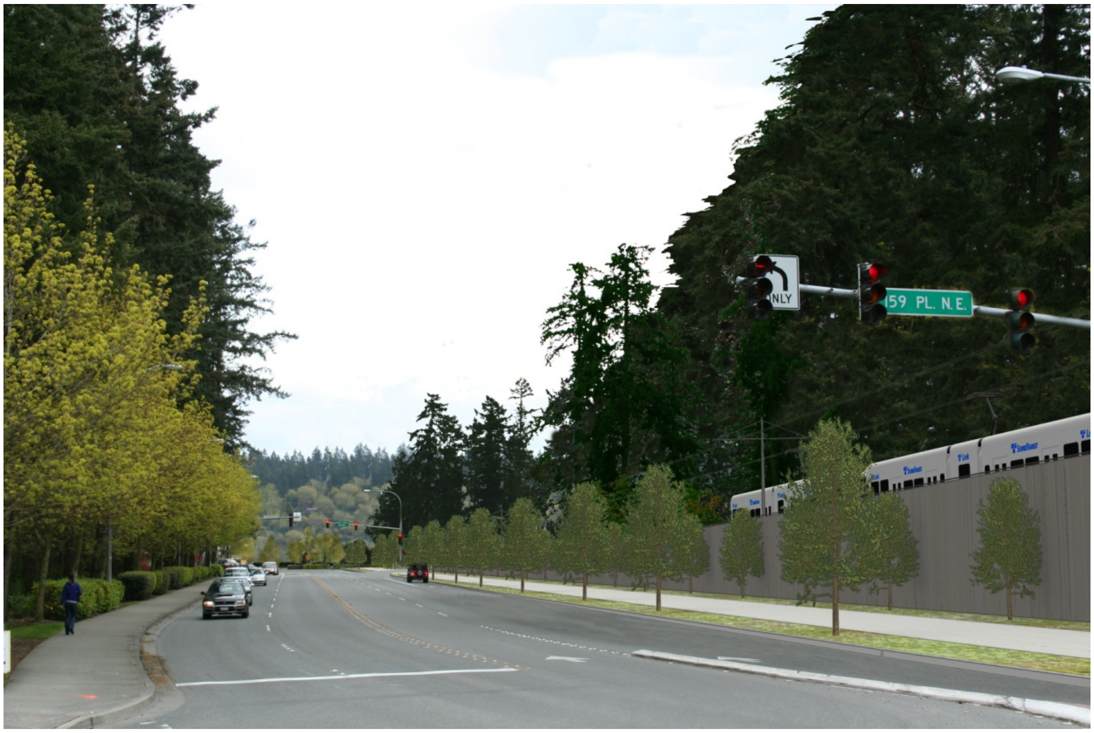
31b. Second Simulation of Leary Way Alternative (E4)



Attachment 1

FHWA Visual Impact Assessment Methodology Used for East Link

Attachment 1

FHWA Visual Impact Assessment Methodology Used for East Link

The purpose of the attachment to Appendix F4.5, Visual Consistency and Key Observation Point Analyses, is to demonstrate how the visual and aesthetic resource analysis was grounded in a formalized approach based upon the FHWA's Visual Impact Assessment methodology using the accepted assessment criteria and terminology for describing visual quality, as set forth in FHWA's *Visual Impact Assessment for Highway Projects* manual. Visual quality assessments examine the composition of the character-defining features for selected views and determine how a proposed project might impact the features of the view. These assessments ask the following questions:

- Is this particular view common or dramatic?
- Is this particular view a pleasing composition (with a mix of elements that seem to belong together) or not (with a mix of elements that either do not belong together or are eyesores and contrast with the other elements in the surroundings)?

Visual quality is determined in terms of three components: vividness, intactness, and unity. These three components are described below:

- **Vividness** is the degree of drama, memorability, or distinctiveness of the landscape components. Vividness is composed of four elements—*landform, vegetation, water features, and human-made elements*—that usually influence the degree of vividness.
- **Intactness** is a measure of the visual integrity of the natural and human-built landscape and its freedom from encroaching elements. This factor can be present in well-kept urban and rural landscapes, as well as in natural settings. High intactness means that the landscape is free of eyesores and is not broken up by features that appear to be out of place. Intactness is composed of two primary elements—*development and encroachment*—that influence the degree of intactness.
- **Unity** is the degree of visual coherence and compositional harmony of the landscape when it is considered as a whole. High unity frequently attests to the careful design of individual components and their relationship in the landscape.

The FHWA's Visual Impact Assessment methodology assigns numeric ratings to the three components that determine visual quality and then averages the ratings to establish an overall visual quality score. The concepts of vividness, intactness, and unity and rating them numerically may be somewhat esoteric for the general reader, and therefore they were not referred to in Section 4.5 of the Draft Environmental Impact Statement, but they were used to determine visual quality categories as illustrated Table 1 and Table 2 of this attachment. Instead of describing and rating vividness, intactness, and unity in Section 4.5, the overall visual quality categories for portions of the segments were described as high, medium and low. This approach was used to describe existing conditions and project impacts. Tables 1 and 2 illustrate how the visual quality categories for existing conditions and project impacts were determined.

Table 1, Existing Visual Quality Categories, describes the existing visual quality categories that were assigned to subareas of the segments illustrated in Exhibits 4.5-1 through 4.5-5. The vividness, intactness, and unity of each subarea were determined and the overall visual quality category established.

Table 2, Change in Visual Quality Categories, explains why and if project alternatives would change the existing visual quality enough to lower the category of the part of the alternative described. In many cases, an alternative would change an area's visual quality but not enough to lower the visual quality category. This assessment focused on impacts that would change the existing visual quality category of one of more categories (e.g., high to medium). If a segment alternative was determined to reduce the visual quality of any segment subarea, then the alternative was determined to adversely impact visual quality. Final EIS Section 4.5 discusses views from or of a project and viewer sensitivity and numbers of affected viewers. These items were not addressed in Table 1 and 2 that follow.

TABLE 1
Existing Visual Quality Categories

	Vividness	Intactness	Unity	Visual Quality Category
Segment A				
Seattle	*Medium* This area is an unmemorable mix of industrial areas, with many large-scale transportation elements and residential. There is low vividness along much of western part of subarea. Near west tunnel portal residential areas and parks, vividness is medium to high.	*Low* Predominance of industrial buildings and lots along with utilitarian-appearing transportation features (freeways) visually encroach on area. Not an intact viewed landscape.	*Low* There is no harmonious, coherent visual pattern to the viewed landscape.	**Low**
I-90 Floating Bridge	*Medium* The floating bridge is a visual distraction from the waters of Lake Washington and shoreline areas, but is a unique and memorable feature. The arch of the southern part of the bridge and the tunnel portals provide an “entry” statement to the bridge for westbound vehicles.	*Low* The bridge is a visual encroachment to views of Lake Washington from nearby shoreline areas and the waters of the lake.	*Medium* The bridge is a built visual element that connects Seattle with Mercer Island. Its presence does not add to the harmony of the view of Lake Washington and areas beyond in which the bridge can be seen.	**Medium**
Mercer Island	*High* This is a unique and distinctive urban landscape with much design thought given to it.	*Medium* The freeway running through the landscaped “valley” and tunnels might be considered encroachments that divide Mercer Island. Mitigation measures (treated walls and vegetation) have been effective in reducing negative impacts.	*Medium* The open-air portions have high unity, and the tunnel portions have low unity.	**Medium**
East Channel Bridge	*Medium* The bridge itself is not as memorable as the floating bridge. It does span a body of water, which makes it somewhat memorable.	*Low* The bridge is a large-scale visual encroachment to views from east channel and shoreline areas.	*Medium* The bridge is a strong visual element that visually connects Mercer Island with Bellevue and forms a visual element/landmark that boaters move under and past.	**Medium**
Segment B				
I-90 from Segment A to Bellevue Way SE off-ramp	*Medium* This area has memorable views to the south from nearby residences, common views to the north of subdivision, and memorable but negative views of I-90 structure from areas below it.	*Low* The freeway is a visual encroachment from areas above it and below it.	*Medium* The elevated I-90 structure that travels from east to west through this area does provide some visual unity, as do expansive views beyond it.	**Medium**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	**Intactness**	**Unity**	**Visual Quality Category**
Bellevue Way SE from I-90 (via off-ramp) to (and including) South Bellevue Park-and-Ride	*Medium* The area has a transportation infrastructure (I-90, ramps, park-and-ride lot, I-90 Trail)-influenced and natural-park character. The presence of Mercer Slough Nature Park is a memorable feature and, along with vegetated hillsides, is a positive visual element.	*Low* The elevated I-90 and on- and off-ramps form a transportation-structure-dominated setting that is visually strong and might be considered an encroachment.	*Medium* The transportation elements and Mercer Slough Nature Park create a unique landscape composed of transportation features in a somewhat natural setting (the park).	**Medium**
Bellevue Way SE from South Bellevue Park-and-Ride to 112th Avenue SE Intersection	*High* Mercer Slough Nature Park to east and heavily vegetated hillside to west are memorable and distinctive for most of Bellevue Way. The vegetation along this part of Bellevue Way SE is almost solid (except for the blueberry farm), which is not typical for urban areas.	*Medium* This attractive linear landscape is largely free of visual intrusion except for residential properties that can be seen on hillsides to the west.	*High* The seen elements (trees, park, blueberry farm, the historic Winters House) form a coherent, harmonious, and almost rural-appearing landscape that has disappeared from much of the Bellevue area.	**High**
Bellevue Way SE from 112th Avenue SE intersection to Segment C	*Medium* A mix of single- and multifamily residential homes with neighborhood small businesses and churches has a mature, well-maintained suburban-neighborhood character. This is a pleasant setting but not memorable.	*Medium* The scale and type of development is what would be expected in a mature, well-maintained suburban residential area with an arterial street going through it. The area has some developments (businesses and new condominiums) that do not contribute to the intactness of the area.	*High* The area generally has a moderately high degree of visual unity that is linked by Bellevue Way SE. The neighborhood has a generally harmonious visual pattern.	**Medium**
112th Avenue SE from Bellevue Way SE intersection to SE 8th Street	*High* The character of adjacent areas is a combination of park-like (along Mercer Slough West and Surry Downs Park), natural (Mercer Slough West), office park (the Bellefield office park), and residential (the Surrey Downs Neighborhood). A memorable setting.	*High* Intactness along most of this area is high and is characterized by the Mercer Slough West, mature trees, landscaped street edges, and well-maintained residences and an office park that Mercer West Slough West encircles.	*High* This area has a well-maintained, suburban arterial street character that is visually unified. It is flanked with sidewalks, numerous trees, and contains a landscaped median (up to SE 8th Street).	**High**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	**Intactness**	**Unity**	**Visual Quality Category**
112th Avenue SE from SE 8th Street to Segment C boundary	*Medium* Most of this part of 112th Avenue SE has the character of a well-maintained and landscaped suburban arterial street with many large street trees. The route passes Surrey Downs Park, the Bellevue Club, residential areas, and hospitality complexes with large parking lots between buildings and 112th Avenue SE. This section of 112th Avenue SE is a pleasant, but not memorable, area.	*High* The intactness of this area is relatively high despite the wide mix of uses. The well-maintained landscaping adjacent to most of 112th Avenue SE helps to visually tie the properties and street together.	*Medium to Low* The variety of land uses and scales (from several-stories hotels to single-story residences and Surrey Downs Park) and setbacks (some buildings are close to the street and others are set back behind large parking lots) create an area that has medium to low unity.	**Medium**
SE 8th Street from 112th Avenue SE to Segment C and area along Alternative B3	*Medium* Most of this part of route has the character of a well-maintained and landscaped suburban arterial street with many large street trees. Portion of Alternative B3 has an undeveloped character. The route passes office parks, residential, park settings. This is a pleasant, but not memorable, area.	*Medium* This area is relatively intact in terms of continuing the suburban office park and residential character of 112th Avenue SE.	*Medium* This area has an average degree of unity in terms of office-building site treatments and the adjacent undeveloped area.	**Medium**
Area between 112th Avenue SE and 114th Avenue SE (for B3 - 114th Extension Design Option).	*Medium to Low* This area passes through a mix of uses that includes an office building in a business park, parking lots, undeveloped area, and a hotel; it also follows I-405. There is a lack of visual coherence along this route.	*Low* The mix of uses and presence of I-405 (which intrudes on views) creates an area of low intactness.	*Medium to Low* The mix of uses and visual elements, such as I-405 along this route, somewhat detracts from visual unity.	**Medium**
Portion of I-90 passing through Mercer Slough Nature Park	*Moderate* The I-90 structure is a memorable physical feature in areas where it can be seen. It has changed the character of the area where it is located. The appearance of the Mercer Slough Nature Park north and south of I-90 and the waters of an arm of Lake Washington to the south are visually vivid.	*Low* This section of I-90 and its associated ramps have been built at varying elevations that range from almost at-grade to high-above-grade, and it is visually disjointed. As a result, the area is low in visual intactness. The I-90 structure's form, line, scale, and color contrast with the nearby landscape of Mercer Slough Nature Park.	*Moderate* The elevated portions of the freeway and on- and off-ramps are visible visual elements that, along with the wetlands associated with the Mercer Slough Nature Park on either side of I-90, provide a moderate degree of visual unity in the area.	**Medium**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	Intactness	Unity	Visual Quality Category
Former BNSF Railway corridor	*Medium* This portion of the route passes through a mixture of areas, many of which are heavily vegetated, thus limiting views. The route would be in the existing railroad corridor and would have some visual connection with the Mercer Slough Nature Park to the west.	*Medium* The freeway and park contrast, and along the former BNSF Railway corridor, the mix of uses are low- to mid-rise buildings, which create a linear area with medium intactness.	*Medium* The corridor has a somewhat isolated and unified appearance. Although the corridor is surrounded by vegetation, the views are connected to large infrastructure (I-90, I-405, and the former BNSF Railway corridor).	**Medium**
114th Avenue SE to Segment C boundary	*Low* This portion of the route would pass between I-405 and various different utilitarian land uses to the west of it. The area is not memorable and is visually dominated by I-405.	*Low* This section of the route has a mix of uses and visual elements. The presence of I-405 is an encroachment on the landscape.	*Low* The mix of visual elements (freeway, ramps, varying types of commercial land uses, etc.) seen along this section of the route detract from visual unity.	**Low**
Segment C				
Bellevue Way NW from Segment B to retained cut (SE 3rd Street)	*Medium* This area contains a mix of land uses, and well-maintained buildings and landscaping of similar suburban character create an area that is generally pleasant but not distinctive or memorable.	*Medium* Much of the area along this section of road is consistent in appearance, although the northernmost part is less intact. The area does not contain visually encroaching elements, although some churches and multifamily buildings are larger in scale than surroundings.	*Medium* The west side of the street has a residential character, with multifamily complexes and single-family residences. The eastern side contains large-scale developments (e.g., hotels, the Bellevue Club) that have large parking lots.	**Medium**
112th Avenue SE from Segment B to Main Street	*Medium* This area has the character of a well-maintained suburban arterial street flanked with sidewalks and trees that is pleasant but not vivid or memorable.	*Low* Areas along the east side of the avenue contain large-scale developments that have large parking lots associated with them.	*Medium* The area has an average degree of unity in terms of land uses with similar character along each side of the avenue (residential and park on the west and large-scale hotel on the east).	**Medium**
112th Avenue NE from Main Street to NE 8th Street (and its bridge over I-405 to Segment D)	*Low* The character of much of this area is dominated by large parking lots and the presence of I-405 and associated structures. It is not a memorable area.	*Low* I-405 structures encroach on the views within the area. Large parking lots are often landscaped, but buildings are set back from street, access to interchanges, and openings between buildings emphasize views of I-405.	*Low* The mix of land uses and transportation elements (I-405) and lack of unifying elements in this transitioning area produces an area that is low in visual unity.	**Low**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	**Intactness**	**Unity**	**Visual Quality Category**
112th Avenue NE from NE 8th Street to NE 12th Street (and its bridge over I-405 to Segment D)	*High and Medium* Since the Draft EIS was published, several projects have been developed along this section of 112th Avenue NE, and some of Bellevue's most distinctive buildings have been built. I-405 is still a dominant visual part of the southern portion of this part of 112th Avenue NE.	*Medium* Intactness is medium. The mixture of older and new buildings with , I-405, on- and off-ramps and bridges over I-405 result in a area that has medium intactness.	*Low to Medium* The mix of land uses and transportation elements (I-405) and lack of unifying elements in this transitioning area produces an area that is low to medium in visual unity.	**Medium**
114th Avenue NE from south of NE 2nd Street (along Alternative C14E) to over NE 6th Street and east over I-405 and NE 8th Street interchange to the former BNSF Railway corridor	*Low* This route parallels and crosses over I-405 and is located next to large parking areas that contribute to the low vividness of this part of 114th Avenue NE.	*Low* The intactness is low because most of the route is next to, or passing over, highway infrastructure.	*Low* A mix of transportation infrastructure shapes and types (freeway over pass right-of-way) produces an area that is low in visual unity.	**Low**
Main Street	*Medium* This section of Main Street passes by areas of single-family residences used for commercial purposes, office buildings and parking lots to the north with views to the east of I-405, and the Main Street overpass. This is not a memorable or vivid area.	*Medium and Low* There are no major encroachments (although I-405 visible to east). The juxtaposition of small homes on one side and tall offices on the other reduces the area to average to low intactness.	*Low* The mixed land uses and scales result in a landscape that is not unified.	**Medium**
108th and 110th Avenues NE between Main Street and NE 12th Street	*High* These portions of the two avenues pass through areas that have been developed or are under construction and would be completed in the near future. This area has an urban character that is vivid and memorable.	*High* City of Bellevue design directives have resulted in a streetscape along much of these streets that has a high degree of intactness, which would be even stronger as projects currently under construction are completed.	*High* The scale and building quality and the streetscape quality give most of these streets a high degree of visual unity.	**High**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	**Intactness**	**Unity**	**Visual Quality Category**
NE 6th Street from 112th Avenue NE to over I-405 and area to the east of I-405 to Segment D boundary	*Medium and Low* The section of NE 6th Street west of 112th Avenue NE is adjacent to the Meydenbauer Conference Center and the north end of Bellevue City Hall plaza. The section is somewhat distinctive and memorable and has a medium visual quality rating. The portion of the street east of 112th Avenue NE passes over I-405 and past areas such as automobile dealerships and low-rise commercial areas that are not vivid or memorable. It has low memorability.	*Medium and Low* The section of NE 6th Street west of 112th Avenue NE has medium intactness due to the quality of the Meydenbauer Conference Center and Bellevue City Hall plaza. East of 112th Avenue SE the mix of land uses and their generally utilitarian appearance create an area that is low in visual intactness. I-405 is a major visual encroachment.	*Low* The street has little visual unity.	**Medium and Low**
NE 12th Street from 108th Avenue NE to I-405	*High* McCormick Park and Ashwood Park are memorable green/open space elements in this part of Bellevue.	*High* Buildings, parks, street trees, and landscape design along this portion of the street have created an area high in visual intactness	*Medium* The mixture of land use and building type in this area (multifamily residential, single-family residential, library, office buildings, and parks) result in an area with medium visual unity.	**High**
114th Avenue SE/NE and Alternative C14E route over I-405 to the former BNSF Railway corridor	*Low* The street parallels along west side of I-405 “behind” (to the west) a mix of buildings surrounded by large parking lots. The route crosses over I-405 to connect to the former BNSF Railway corridor. The areas along this route have a lack of visual coherence and are dominated by I-405 and large parking lots.	*Low* I-405 and parking lots encroach on the views within the area.	*Low* The mixture of land uses and transportation elements (I-405) and lack of unifying elements in this area result in an area that is low in visual unity.	**Low**
Segment D				
All of Segment D except for area described below	*Low* Most of the alternatives in Segment D would primarily pass through areas that have either an industrial (distribution and manufacturing) or commercial (numerous automobile-dependant businesses with large parking areas) character. These areas are utilitarian in appearance and low in memorability or vividness.	*Low* The mix of land uses and their generally utilitarian appearance creates an area that is low in visual intactness. I-405 is a major visual encroachment along some of the alternatives.	*Low to Medium* Some of the alternatives are in areas that are at least partially unified in terms of having an industrial (or retail) character and others pass through areas that contain a mixture of land uses and have low visual unity.	**Low**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	Intactness	Unity	Visual Quality Category
152nd Avenue NE from NE 24th Street to SR 520	*Medium* Many buildings are closer to the street along this section of the avenue with smaller and less visually dominating parking lots. There is more mature and abundant landscaping and more street trees, and the overall character of the avenue is that of a somewhat well-maintained suburban commercial district and office park.	*Low* There is a mixture of land uses and scales along this section of the avenue that does not lend a visual consistency or intactness to this area.	Medium The streetscape, landscaping, and building relationship to the street create an area of medium visual unity.	**Medium**
Segment E				
SR 520 from Segment D to where project alternatives diverge from each other before passing by Marymoor Park	*Low* The landscape seen along this segment contains a variety of different types of land uses. It is dominated by the presence of SR 520 and is not memorable or vivid.	*Low* SR 520 is a disruptive presence that is looked up to from areas below it or looked down upon from areas above it.	*Medium* This area has medium visual unity because SR 520 is a consistent and strong visual presence along this portion of Segment D, which helps somewhat visually unify the areas it passes next to.	**Low**
West Lake Sammamish Parkway Northeast from SR 520 off-ramp to near the Sammamish River	*Medium* The viewed landscape is a mixture of vegetated hillside, multifamily buildings, a strip-mall shopping area, and arterial road with some views of the Sammamish River and park lands. The area has medium vividness.	*Medium* Intactness in this area is medium in that there are no major encroachments and some intactness from the nearby linear river, park, and vegetated hillside.	*Medium* The area along this section of parkway has some unity, but it is not exceptional.	**Medium**
NE Redmond Way over Sammamish River to the former BNSF Railway corridor	*High* The area along this stretch of road passes over the Sammamish River and valley and adjacent park lands. The view along the river and adjacent parklands is memorable and vivid.	*Medium* The area has an intact appearance due to the river, park lands, and vegetation. The bridge is a slight intrusion that slightly lowers intactness.	*High* The river, park lands, and heavy vegetation create a unified landscape.	**High**
Leary Way NE from SR 520 off-ramp to the former BNSF Railway corridor	*High* The area along this stretch of road passes over the Sammamish River and adjacent park lands as it enters the old part of Redmond and a tree-lined street. The scene is vivid and memorable.	*High* The area has an intact appearance due to the river, park lands, and vegetation. The bridge is designed as a built amenity that only slightly lowers intactness.	*High* The river, park lands, and heavy vegetation create a unified landscape.	**High**

TABLE 1 CONTINUED
Existing Visual Quality Categories

	Vividness	**Intactness**	**Unity**	**Visual Quality Category**
Former BNSF Railway corridor	*Medium* The area along much of the corridor passes behind buildings, and much of it has an industrial character that is low in vividness and memorability. The lands on which the tracks are located are generally not well maintained. The area near Redmond Town Center (away from the tracks) is somewhat memorable and vivid.	*Low* The area has a generally mixed appearance as a result of different land uses along the route, many of which have their backs or service loading areas oriented along the old railroad route. The area has a low degree of intactness.	*Low* There is a lack of visual unity along the route.	**Low**
Along SR 520 (east of where Alternatives E1 and E4 would leave the SR 520 corridor) to the former BNSF Railway corridor and along 161st Avenue NE	*High* Most of this section of SR 520 is located low on the landscape, passes next to Marymoor Park and the Sammamish River, and offers views of Mount Rainier. It is a vivid and memorable landscape.	*Medium* The viewed landscape is intact with the exception of SR 520. However, the low elevation of most of the freeway reduces its intrusion into the landscape considerably.	*High* The viewed landscape has a unified appearance due to park lands to the south and the heavily vegetated river corridor and retail developments to the north.	**High**

TABLE 2
Change in Visual Quality Categories

Segment/ Subarea of Segment	**Vividness** (*Existing)*/**with Project**	**Intactness** (*Existing)*/**with Project**	**Unity** (*Existing)*/**with Project**	**Visual Quality Category** *(Existing)***/ with Project**
Segment A				
1. Seattle	*(Medium)/***No change in rating** Project components would be located along existing freeway structure and would have little influence on vividness.	*(Low)/***No change in rating** The presence of the elevated station, the sight of people getting in and out of the light rail vehicles, and the moving light rail vehicles themselves might slightly increase visual interest and human scale compared to viewing freeway lanes and moving vehicles but not enough the change the low rating.	*(Low)/***No change in rating** The view of moving light rail vehicles would be consistent with the view (or visual pattern) of moving vehicles when viewed from many locations along this sub-segment.	*(Low)***/No change in category**
2. I-90 Floating Bridge	*(Medium)*/**No change in rating** The light rail vehicles and overhead catenary system (OCS) would be visible on the bridge to varying degrees depending upon viewing distance and location but would not change the medium degree of vividness.	*(Low)/***No change in rating** There would be little change to the established transportation-infrastructure-oriented character of the floating bridge.	*(Medium)***/No change in rating** The view of moving light rail vehicles would be consistent with the view (or visual pattern) of moving vehicles when viewed from many locations.	*(Medium)*/**No change in category**
3. Mercer Island	*(High)***/No change in rating** The Mercer Island Station and associated components would not change the uniqueness and memorability of this section of I-90.	*(Medium)***/No change in rating** The character of this portion of I-90 would be expanded from that of a vehicular-oriented freeway physically separated from the nearby areas to a mix of freeway and rapid transit with physical and more visual access to nearby area,	*(Medium)***/No change in rating** The Mercer Island Station and associated components would help physically and visually connect I-90 to the areas above it and would slightly improve visual unity.	*(Medium)***/No change in category**
4. East Channel Bridge	*(Medium)/***No change in rating** The light rail vehicles and OCS would be visible on the bridge to varying degrees depending upon viewing distance and location but would not change the medium degree of vividness.	*(Low)***/No change in rating** The presence of light rail vehicles and OCS would not add to the encroachment of the existing bridge and would cause little change to intactness.	*(Medium)***/No change in rating** The presence of light rail vehicles and OCS would not change the medium unity of the bridge.	*(Medium)***/No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	Vividness (*Existing)*/**with Project**	Intactness (*Existing)*/**with Project**	Unity (*Existing)*/**with Project**	Visual Quality Category (*Existing*)/ with Project
Segment B				
Preferred 112th SE Modified Alternative (B2M)				
5. From Segment A to (and including) South Bellevue Park-and-Ride	*(Medium)/***No change in rating** The elevated portion of the alternative that would depart the I-90 elevated structure would be located in front of the I-90-to-Bellevue-Way ramp when viewed from the hillsides to the northwest. The light rail vehicles and OCS would be visible but would not block views to the south and would not change the medium degree of vividness. The alternative would introduce another transportation-oriented structure into the landscape, but this would not be enough to change the medium vividness rating. The elevated to retained cut alignment and parking structure and associated landscaping would be designed to be pleasant in appearance and would not detract from the medium vividness of the area.	*(Low and Medium)/***No change in rating** The elevated and at-grade/retained cut parts of the route would somewhat visually detract from the areas they would pass through or by, but not enough to reduce the intactness ratings of these areas.	(*Medium*)/**No change in rating** The at-grade route could be considered to visually help unify the streets it would pass along. The presence of the retained cut walls, light rail vehicles, and OCS would add visual elements that would be noticed by viewers, they but would not be dominant. These features would not change the existing visual unity of this area enough to lower its rating from medium to low.	*(Medium)*/**No change in category**
6. Bellevue Way SE from South Bellevue Park-and-Ride to the 112th Avenue SE intersection	*(High)/***No change in rating** The west side of Bellevue Way SE would retain vegetation along it and would maintain a high degree of vividness. Despite the removal of vegetation and presence of light rail vehicles, the retained cut, and OCS along the east side of Bellevue Way SE. The east side of Bellevue Way SE would retain a high degree of vividness.	*(High)/***Medium** The removal of vegetation within Mercer Slough Nature Park and the presence of the light rail vehicles, retained cut, and the OCS along the east side of this portion of Bellevue Way SE next to the Mercer Slough Nature Park, blueberry farm and the Winters House would somewhat disrupt the rural-natural appearing landscape along this corridor and lower its intactness from high to medium.	*(High)/***No change in rating** Although the appearance of this section of Bellevue Way SE would change, its high degree of unity would remain. The edge of the Mercer Slough Nature Park would still define the eastern edge of this transportation corridor. With this alternative remaining vegetation in the park would still be seen along the east side of the alignment.	*(High)/***No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	**Vividness** (*Existing)*/**with Project**	**Intactness** (*Existing)*/**with Project**	**Unity** (*Existing)*/**with Project**	**Visual Quality Category** (*Existing*)/ **with Project**
Preferred 112th SE Modified Alternative (B2M) to Preferred Alternative C11A				
7. 112th Avenue SE from Bellevue Way SE intersection to SE 8th Street	*(High)/*__Medium__ From approximately SE 15th Street, landscaped medians would be removed and the alternative would run down the center of 112th Avenue SE to SE 8th Street. Trees along 112th Avenue SE and along the edge of Mercer Slough Nature Park would be removed. Removing this vegetation would lower the vividness rating. More views towards the Mercer Slough West and Bellefield Office Park would be possible by removing vegetation east of 112th Avenue SE. The vividness of this area would be reduced to medium.	*(High)/*__No change in rating__ Although the landscaped median and other trees would be removed, the Mercer Slough Nature Park and landscaped areas along the west side of 112th Avenue SE would remain strong visual components and would allow the areas intactness to remain high.	*(High)/*__No change in rating__ This area would retain its well-maintained, suburban street character and high unity despite the removal of the landscaped median and other trees and presence of retained cut walls, light rail vehicles, and OCS.	*(High)/*__No change in category__
8. 112th Avenue SE from SE 8th Street to Segment C boundary	(*Medium*)/**No change in rating** Extending the alternative north down the center of 112th Avenue SE and the at-grade station and widening the street near the station the SE 8th Station would remove landscaped medians and adjacent vegetation. These medians do not have as many trees as the median south of SE 8th Street. The station would be pedestrian in scale and would increase the view's vividness. Removing vegetation would lower the area's memorability. Overall, vividness would not change.	*(Medium)/*__No change in rating__ Removing the landscaped medians and vegetation on adjacent to 112th Avenue SE and constructing the at-grade station would increase the amount of paved areas and reduce the area's intactness, but not enough to lower it from medium to low.	*(Medium to Low)/*__No change in rating__ There would be no change in the medium to low unity of this area with the presence of the alignment and station.	*(Medium)/*__No change in category__

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	**Vividness** (*Existing)*/**with Project**	**Intactness** (*Existing)*/**with Project**	**Unity** (*Existing)*/**with Project**	**Visual Quality Category** *(Existing)***/ with Project**
Preferred 112th SE Modified Alternative (B2M) to Preferred Alternative C9T				
9. 112th Avenue SE from Bellevue Way SE intersection to SE 8th Street	*(High)/***No change in rating** Most of the landscaped medians and vegetation along the west side of 112th Avenue SE would remain. Removing trees and vegetation along the east side of 112th Avenue SE would be noticed as would the retained cut walls, light rail vehicles, and OCS. However, the overall views along this corridor would still include considerable nearby vegetation, and many areas would have a memorable and park-like appearance. Overall, the alternative would be less visible that others due to being in the retained cut.	*(High)/***Medium** This area would still contain much vegetation, and the Mercer Slough Nature Park would be an important visual element, but the presence of the retained cut walls, light rail vehicles, and OCS would lower the intactness of this area.	*(High)/***No change in rating** This area would retain its well-maintained, suburban arterial street characteristic and high unity despite the removal of the landscaped median and other trees and presence of retained cut walls, light rail vehicles, and OCS.	*(High)***/No change in category**
10. 112th Avenue SE from SE 8th Street to Segment C boundary	*(Medium)***/Low** The alignment along the east side of 112th Avenue SE and the at-grade station would remove a number of existing trees and other adjacent roadside vegetation. The part of the street near the station that would be widened would reduce vividness of the area from medium to low.	*(Medium)*/**No change in rating** The at-grade route, station, and widened street would introduce new at-grade visual elements. Because they would be street-level features, they would not encroach on views but would remove several street trees from the east side of the street. This would widen the overall intersection, thus lowering the intactness somewhat. This affects views toward the business park, but the widened roadway would not lower the intactness to low.	*(Medium and Low)* **No change in rating** There would be no change in the medium to low unity of this area with the presence of the alignment.	*(Medium)***/No change in category**
Bellevue Way Alternative (B1)				
11. From Segment A to (and including) South Bellevue Park-and-Ride	*(Medium)/***No change in rating** The impact of the elevated portion would be the same as *Preferred Alternative B2M*. The presence of the at-grade route would result in some street widening (and loss of some trees), but its presence and seeing the light rail vehicles and OCS would not change the pleasant, medium vividness of the areas that it would pass through.	*(Low and Medium)/***No change in rating** The impact of the elevated portion would be the same as *Preferred Alternative B2M*. The at-grade route would not visually encroach on the areas it would pass through enough to reduce intactness ratings along the portions of the route with medium intactness.	*(Medium and High)/***No change in rating** The impact of the elevated portion would be the same as *Preferred Alternative B2M*. The at-grade route could be considered to visually help unify the areas along its route.	*(Medium)***/No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	**Vividness** (*Existing)*/**with Project**	**Intactness** (*Existing)*/**with Project**	**Unity** (*Existing)*/**with Project**	**Visual Quality Category** *(Existing)*/ **with Project**
12. Bellevue Way SE from South Bellevue Park-and-Ride to the 112th Avenue SE intersection	*(High)/***Medium** Placing the route partially into the west hillside, removing vegetation, installing retaining walls, and introducing light rail components would lower the undeveloped, almost rural landscape character of this section of Bellevue Way SE and reduce its vividness to medium.	*(Medium)*/**No change in rating** The at-grade route would not be considered an encroaching visual element in that it would not be out of scale, line, or form with the surroundings environment of an arterial road.	*(High)*/**Medium** The current unified appearance of this portion of Bellevue Way SE would be reduced from high to medium as a result of removing trees and locating this part of the route partially into the hillside.	*(High)*/**Medium**
13. Bellevue Way SE from 112th Avenue SE Intersection to Segment C	*(Medium)/***No change in rating** The at-grade alignment would be compatible with the character of the areas it would pass through and might slightly add to its vividness.	*(Medium)/***Medium** The at-grade route would not be considered an encroaching visual element in that it would not be out of scale, line, or form with the surroundings environment of an arterial road.	*(High)/***High** The at-grade alignment would contribute to this areas high degree of visual unity.	*(Medium)*/**No change in category**
112th SE At-Grade Alternative (B2A)				
14. From Segment A to (and including) South Bellevue Park-and-Ride	Impacts would be the same as those described for Alternative B1.	Impacts would be the same as those described for Alternative B1.	Impacts would be the same as those described for Alternative B1.	*(Medium)/***No change in category**
15. Bellevue Way SE from South Bellevue Park-and-Ride along 112th Avenue SE to the intersection with SE 8th Street	*(High)/***Medium** Impacts would be similar to Alternative B1, but there would be less impact from retaining walls. More of the light rail system components (OCS and light rail vehicles) would be seen from approximately 15 to 20 residences on the hillside to the west than would be seen with Alternative B1.	*(Medium)/***No change in rating** Although vegetation would be removed, the at-grade route would not be considered enough of an encroaching visual element to lower the intactness rating to low.	*(High)*/**Medium** Removing vegetation and building retaining walls would introduce elements that would reduce the current cohesive and harmonious visual pattern of the landscape along the west side part of the route. Visual unity along the route would decrease.	*(High)*/**Medium**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	Vividness (*Existing)***/with Project**	Intactness (*Existing)***/with Project**	Unity (*Existing)***/with Project**	Visual Quality Category (*Existing*)**/ with Project**
16. 112th Avenue SE from SE 8th Street intersection to Segment C boundary	*(Medium)***/Low** The at-grade station and part of the retained cut that leads to the tunnel portal would be seen in this area. The expansion of 112th Avenue SE to the east and west would remove several existing trees and other adjacent roadside vegetation. The station and cut-and-fill structure would be pedestrian in scale and would increase the view's vividness. Existing trees would be removed and the part of the street near the station widened, which would lower the memorability and reduce vividness to low.	*(Medium)/***No change in rating** The at-grade route, station, and retained-cut and widened street would introduce new at-grade visual elements. Because they would be street-level features, they would not encroach on the view but would remove several street trees from the east side of the street. This would widen the overall intersection, thus lowering the intactness somewhat. This affects views toward the business park, but the widened roadway does not lower the intactness to low.	*(Medium)***/No change in rating** Expanding 112th Avenue SE to the east and west would remove several existing trees and other adjacent roadside vegetation. The at-grade station and retained cut would appear to be the "end" of the route, as it transitions underground. Primary features of the visual environmental remain unified.	*(Medium)/***No change in category**
112th SE Elevated Alternative (B2E)				
17. From Segment A to (and including) Bellevue Park-and-Ride	*(Medium)*/**No change in rating** When viewed from the hillsides to the northwest, the elevated portion of the route that would depart the I-90 elevated structure would be located in front of the I-90 Bellevue Way ramp. It would introduce another transportation-oriented structure into the landscape but would not lower the rating. The light rail vehicles and OCS would be visible but would not block views to south and would not change medium degree of vividness.	*(Medium)/***No change in rating** Light rail vehicles and OCS would be seen near I-90 but would not be visible enough to be considered visual encroachments. As described under vividness, the elevated portion of the route would be visible in an area where intactness is already low largely due to elevated I-90 structures, and it would not be out of character with the I-90 structures.	*(Low)***/No change in rating** Light rail vehicles and OCS would be seen near I-90 but would not add to the low visual unity rating. The elevated portion of the route would be visible in an area where unity is already low due the number of types of features in this area.	*(Medium)***/No change in category**
18. Bellevue Way SE from South Bellevue Park-and-Ride along 112th Avenue SE to the intersection with SE 8th Street	*(High)***/Medium** The elevated structure, OCS, and light rail vehicles would intrude into eastern views from approximately 15 to 20 residences on hillsides to west of the route. The constructed project components would not block or seriously impinge on views, but they would contrast with the existing view in terms of line, form, and color and lower vividness from high to medium.	*(Medium)/***No change in rating** The elevated structure, OCS, and light rail vehicles would be seen from (and encroach on the view from) approximately 15 to 20 residences to the west but would not lower the existing medium intactness to low.	*(High)*/**Medium** The project elements discussed under vividness would also reduce the existing visual pattern of the view to the east seen from the approximately 15 to 20 residences on hillside to the west.	*(High)*/**Medium**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	Vividness (*Existing)*/**with Project**	Intactness (*Existing)*/**with Project**	Unity (*Existing)*/**with Project**	Visual Quality Category (*Existing*)/ **with Project**
19. 112th Avenue SE from SE 8th Street intersection to Segment C boundary	*(Medium)*/**Low** The elevated structure and station would add large-scale visual elements to this part of the route. The structure and particularly the station would contrast with the area's existing character. Existing trees would be removed. Together, with the large overhead station, the change would lower the memorability and reduce vividness to low.	*(Medium)*/**No change in rating** The elevated structure and station would introduce large-scale elements into the area and over 112th Avenue SE. They would encroach on the setting of the intersection and area along 112th Avenue SE, remove a number of trees, and cast shadows; this would lower the existing intactness. The structure is consistent with the office park that it adjoins and, therefore, would not cause the existing rating to be lowered to low.	*(Medium)*/**No change in rating** The presence and scale of the elevated structure and station along with the removed large landscaped area between the station and an office building east of it would reduce the unity rating, but not enough to change the rating to low.	*(Medium)*/**No change in category**
112th SE Bypass Alternative (B3)				
20. From Segment A to (and including) Bellevue Park-and-Ride	Impacts would be the same as those described for Alternative B1.	Impacts would be the same as those described for Alternative B1	Impacts would be the same as those described for Alternative B1	*(Medium)*/**No change in category**
21. Bellevue Way SE from South Bellevue Park-and-Ride along 112th Avenue SE to the intersection with SE 8th Street	Impacts would be the same as those described for this part of Alternative B2A.	Impacts would be the same as those described for this part of Alternative B2A.	Impacts would be the same as those described for this part of Alternative B2A.	*(High)*/**Medium**
22. North of intersection of 112th Avenue SE and SE 8th Street to Segment C boundary	*(Medium)*/**No change in rating** Elevated structure, OCS, and light rail vehicles would be seen crossing over 112th Avenue SE and SE 8th Street and passing between office buildings. It would be seen from SE 8th Street and I-405 as the route passes through an undeveloped area. The presence of the elevated structure would contrast with the undeveloped area it would pass over but would not be out of character with nearby raised I-405 and ramps; therefore, it would not impact medium vividness enough to lower rating to low.	*(Medium)*/**No change in rating** The existing mix of uses near the route results in its medium intactness. The elevated structure would slightly lower intactness but would not encroach enough on the existing views to reduce the intactness rating to low.	*(Low)*/**No change in rating** The elevated structure would add another visual element to the mixed visual patterns and elements in this area. It would not change the existing unity rating.	*(Medium)*/**No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	Vividness (*Existing)*/**with Project**	Intactness (*Existing)*/**with Project**	Unity (*Existing)*/**with Project**	Visual Quality Category (*Existing*)/ **with Project**
B3 – 114th Extension Design Option				
23. From 112th Avenue SE northeast to 114th Avenue SE	*(Medium to Low)/***No change in rating** Retained fill and elevated alignments would not change the vividness ratings of this segment and might increase it.	*(Low)*/**No change in rating** The elevated structure would not change the already low intactness of this area, particularly along I-405.	*(Medium to Low)*/**No change in rating** The retained fill and elevated alignments of this design option would be located in an area with medium to low coherence and would not lower the overall unity.	*(Medium)/***No change in category**
BNSF Alternative (B7)				
24. From Segment A boundary to Bellevue Way SE Ramp	*(Medium)/***No change in rating** The elevated structure would be viewed from the hillsides to the north. The alternative would introduce another transportation-oriented structure into the landscape, but this would not be enough to change the vividness rating.	*(Low)/***No change in rating** The elevated structure would not be considered an encroaching visual element in that it would not be similar in elevation, appearance, and scale with existing the elevated I-90 structure.	*(Medium)/***No change in rating** The unity would not change with the presence of another elevated structure (in addition to I-90) along this part of the route.	*(Medium)/***No change in category**
25. Alternative B7 route from Bellevue Way SE ramp along portion of I-90 passing through Mercer Slough Nature Park	*(Medium)/***No change in rating** The elevated structure would add another large-scale elevated visual element to this area. The visually dominating presence of the I-90 structure next to the I-90 Trail and I-90's associated ramps (which the trail passes underneath) make this area a visually unique area but blocks most views to the south. The elevated structure would be located north of the I-90 Trail and would allow views under it to areas within Mercer Slough Nature Park. The presence of the elevated structure would not decrease the area's medium vividness rating to low.	*(Low)/***No change in rating** The presence of the elevated structure would contribute to the low intactness established by the I-90 structure and associated ramps.	*(Medium)/***No change in rating** Along portions of the I-90 Trail where viewers would see the elevated structure (many portions would continue to be screened by nearby vegetation), the elevated structure would partially intrude on north views of vegetation in the Mercer Slough Nature Park, although there would be views under the structure and between its columns) but would change the medium visual unity enough to reduce it to low.	*(Medium)***/No change in category**
26. Former BNSF Railway corridor	*(Medium)/***No change in rating** The at-grade route would not change the medium vividness of this section of the largely visually contained (i.e., separated from many views by terrain and vegetation) corridor.	*(Medium)/***No change in rating** The at-grade route would not change the medium intactness of this section of the corridor.	*(Medium)/***No change in rating** The at-grade route would not change the medium unity of this section of the corridor.	*(Medium)/***No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	**Vividness** (*Existing)*/**with Project**	**Intactness** (*Existing)*/**with Project**	**Unity** (*Existing)*/**with Project**	**Visual Quality Category** *(Existing)***/ with Project**
27. 114th Avenue SE to Segment C boundary	*(Low)*/**No change in rating** The elevated structure and station would add memorable and well-designed architectural visual features to this area but would not improve vividness enough to raise the category to medium.	*(Low)/***No change in rating** The elevated structure and station would somewhat encroach on some of the (limited) views from I-405 towards parts of Mercer Slough Nature Park.	*(Low)/***No change in rating** The elevated structure and station would add another visual feature to this area, which is low in visual unity. The presence of the elevated structure along the length of the route might provide additional visual unity.	*(Low)*/**No change in category**
Segment C				
Preferred 108th NE At-Grade Alternative (C11A)				
28. 112th Avenue SE from Segment B to Main Street	*(Medium)/***No change in rating** The medium vividness of this portion of 112th Avenue SE would not be greatly affected by the removed vegetation along the west side of 112th Avenue SE and Surrey Downs Park and the removed residences. The area would retain its character of a well-maintained suburban arterial street flanked with sidewalks and trees that is pleasant but not vivid or memorable.	*(Low)/***No change in rating** The low intactness rating is primarily due to land uses along the east side of 112th Avenue SE, so it would not be affected.	*(Medium)/***No change in rating** The areas medium degree of unity would not change with the presence of this alternative.	*(Medium)* **No change in category**
29. Main Street to NE 8th Street	*(Medium)/***No change in rating** Removing vegetation (and relandscaping) and residences and constructing the elevated and retained fill alignments along with the station would not lower the areas medium vividness enough to reclassify it as low.	*(Medium and Low)/***No change in rating** The presence of the elevated and retained fill structures and the station would not negatively affect the areas medium and low intactness rating, and potential landscaping and aesthetic treatments might improve it.	*(Medium)/***No change in rating** The presence of the alternative would add some visual unity to this area but not enough to change the medium rating. The design and aesthetic treatment for the portions of the alignment along Main Street would result in a landscaped buffer and transition area between the residential neighborhood south of Main Street and the commercial areas and the city center to the north and could increase unity.	*(Medium)* **No change in category**
30. NE 8th Street to NE 6th Street	*(High)/***No change in rating** At-grade route and station would fit in with the urban character of this area and would positively add to its high vividness rating.	*(High)/***No change in rating** At-grade route and station would complement the high intactness rating.	*(High)/***No change in rating** At-grade route would add to visual unity of these avenues.	*(High)/***No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Shadows would be seen below the elevated structure and station.	*(Low)/***No change in rating** The elevated structure and station might be considered an encroaching element from some buildings but would not change intactness when viewed from ground level.	*Low/***No change in rating** The elevated structure could add some visual unity to this area that is low in visual unity.	*(Low)***/No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	**Vividness** (*Existing)*/**with Project**	**Intactness** (*Existing)*/**with Project**	**Unity** (*Existing)*/**with Project**	**Visual Quality Category** (*Existing)*/ **with Project**
50. 112th Avenue NE from NE 8th Street to NE 12th Street (and its bridge over I-405 to Segment D) subsegment	*(Medium)/***No change in rating** The elevated structure would not diminish the area's medium vividness and might slightly add to its memorability. The structure would introduce a large-scale feature to the streetscape that would contrast in form and line with nearby buildings and create a shadow on the street and sidewalks below. The alternative would not lower vividness enough to lower the vividness rating to low.	*(Medium)/***No change in rating** The elevated structure might be considered an encroachment for viewers seeing it from nearby buildings, but it would not lower the intactness rating to low.	*(Medium)/***No change in rating** The elevated structure would not diminish and could slightly add to the visual unity of this portion of 112th Avenue NE.	*(Medium)*/**No change in category**
51. NE 12th Street from 112th Avenue SE over I-405 to Segment D	*(Medium and Low)*/**No change in rating** The elevated structure would not pass through McCormick Park. It would, however, be seen over I-405 but would not lower existing vividness ratings.	*(Low)*/**No change in rating** The elevated structure would not change existing visual character of the areas it would pass thorough and would not improve the low intactness.	*(Low)*/**No change in rating** The elevated structure would have little influence on unity of the area it would pass though.	*(Low)*/**No change in category**
112th NE Elevated Alternative (C7E) from Alternatives B3 andB7				
52. From Alternative B3 and Alternative B7	*(Low)*/**No change in rating** The elevated structure and East Main Station would be noticed along this section of 114th Avenue SE (as would the Alternative B3 route that approaches I-405) that closely parallels I-405. They would not detract further from the area's low vividness rating and may add a vivid element to the area.	*(Low)*/**No change in rating** The elevated structure and station would have little influence on the existing low intactness of these routes.	*(Low)/***No change in rating** The elevated structure and station could add visual unity to this area along its route but not enough to change the rating.	*(Low)*/**No change in category**
110th NE Elevated Alternative (C8E) from Alternatives B2A and B2E				
53. From Segment B along 114th Avenue SE to NE 2nd Street	*(Low)/***No change in rating** The elevated structure and station would be noticed along this section of 114th Avenue SE, which closely parallels I-405, but it would not detract further from the area's low vividness rating and may add a vivid element to the area.	*(Low)/***No change in rating** The elevated structure and station would have little influence on the existing low intactness of the portion of the route next to I-405 or the area near NE 2nd Street.	*(Low)/***No change in rating** The elevated structure and station could add visual unity to this area along its route but not enough to change the rating.	*(Low)* **No change in category**

TABLE 2 CONTINUED
Change in Visual Quality Categories

Segment/ Subarea of Segment	Vividness (*Existing)*/with Project	Intactness (*Existing)*/with Project	Unity (*Existing)*/with Project	Visual Quality Category *(Existing)*/ with Project
54. 110th Avenue NE	*(High)*/**Medium** The presence of the elevated structure, station, and straddlebents would introduce large-scale elements above the streetscape of this densely developed area's urban character. The station would be designed to be compatible with the character of the area near it. The station and elevated structure would be seen at eye-level from some nearby offices and from below from sidewalks. Shadows would be cast at certain times of the day on the street and sidewalks below (in addition to those cast by nearby buildings).	*(High)*/**Medium** The elevated structure and station may be considered visual encroachments by some viewers and appropriate urban features by others. The high intactness of much of 110th Avenue NE would be lowered to medium by the elevated structure and to a lesser degree by the elevated station.	*(High)*/**No change in rating** 110th Avenue NE has a generally unified, urban appearance that would not be lowered enough by the elevated structure or station to reduce the rating from high to medium.	*(High)*/**Medium**
55. NE 12th Street from 108th Avenue NE to 112th Avenue NE	*(High and Medium)*/**Low initially, then over time Medium** The elevated structure would start near 110th Avenue SE and would remove vegetation along the portion of McCormick Park between 110th and 112th Avenue NE, which would change the existing high vividness to low. Within several years of reconstruction, the redesigned and replanted park would reach medium vividness.	*(High)*/**Low initially, then over time Medium** Removing vegetation and constructing the elevated structure would initially lower intactness along McCormick Park to low until vegetation begins to fill in, which would increase intactness to medium.	*(Medium)*/**Low initially, then over time Medium** Removing vegetation and constructing the elevated structure would lower existing unity to low until vegetation begins to fill in, which would increase unity to medium.	*(High)*/**Low initially, then over time Medium**
56. NE 12th Street from 112th Avenue SE over I-405 to Segment D	*(Medium and Low)*/**No change in rating** The elevated structure would be seen over I-405 but would not lower existing vividness ratings.	*(Low)*/**No change in rating** The elevated structure would not change existing visual character of the areas it would pass through and would not improve the low intactness.	*(Low)*/**No change in rating** The elevated structure would have little influence on unity of the area it would pass though.	*(Low)*/**No change in category**

Washington State Intersection Screening Tool (Version 2.0) and Greenhouse Gas Estimating Methodologies and Results

Washington State Intersection Screening Tool (Version 2.0) and Greenhouse Gas Estimating Methodologies and Results

PREPARED FOR:	Sound Transit
PREPARED BY:	Joza Bautista/Entech Consulting Group
COPIES:	Michelle Jones/Entech Consulting Group
DATE:	November 1, 2010

The East Link Project is located in a carbon monoxide (CO) maintenance area; therefore, the state and federal air quality conformity regulations require a demonstration to ensure transportation activities associated with the project will not cause new air quality violations, worsen existing violations, or delay timely attainment of the National Ambient Air Quality Standards (NAAQS). To satisfy this requirement, air quality modeling is used to calculate air quality impacts for comparison of build with no build conditions. The project must meet air quality conformity standards for a CO maintenance area. CO is the only pollutant for which quantitative modeling guidance for transportation projects exists.

The Washington State Intersection Screening Tool (WASIST), Version 2.0, was selected to model and analyze the CO levels of the specifically impacted intersections in the project vicinity. Developed by the Washington State Department of Transportation (WSDOT), WASIST is a screening model for determining the worst-case scenario for CO concentrations at signalized intersections and on metered roadways. WASIST uses predefined traffic data to estimate the project-generated CO emissions by inputting a combination of worse-case scenarios simultaneously into the model to produce the highest possible level of CO emissions. By using a combination of these worse-case scenarios and predefined data assumptions, the model can estimate worse-case CO concentrations for intersections and metered roadways within the project area. Traffic data for the project area were collected to determine which intersections would be representative for modeling and further degrade the level of service (LOS) from "D" to "E" or "F" under the future build alternatives. Screened intersections meeting these criteria underwent a CO hot-spot modeling screening analysis. If the worse-case intersections do not impact air quality, then all other intersections would experience a lesser impact. Exhibits 4.6-2 through 4.6-4 in Section 4.6, Air Quality, of the Final EIS show all intersections considered and those that meet the WASIST criteria for modeling CO concentrations.

The initial step in the WASIST modeling process is to perform a prescreen. This requires three informational inputs: the intersection location, the traffic volume on the intersection's busiest leg, and the distance of the closest receptors to the roadway edge. Once these are entered into the model, the results of the prescreen are summarized and displayed with a "pass" or "fail" result given in the report. A "pass" result does not require a complete WASIST analysis; a "fail" result, however, does require a complete WASIST analysis be performed to better estimate the intersection's impact on ambient CO concentrations. There are three informational data input categories necessary to perform a complete WASIST analysis:

1. **General inputs.** These include the project's general characteristics, such as the project name, intersections name, year of the analysis, background concentration, and whether the project is located in a CO maintenance area.
2. **Intersection inputs.** These include detailed information on the modeled intersection, the intersection layout, peak-hour traffic volumes, approach speed, and signal timing.
3. **Receptor inputs.** These include more specific information concerning receptors and the distance from the edge of the roadways and quadrants in which they are located.

After these informational data inputs are entered, the model calculates the worst-case CO concentrations at the specified intersections. The results of the 1-hour and 8-hour CO concentrations that were calculated are summarized in a report. If the specified receptor CO concentrations are less than the 1-hour and 8-hour NAAQS of 35 parts per million (ppm) and 9 ppm, respectively, then the intersection does not require further CO hot-spot dispersion modeling, and it passes the complete WASIST analysis. Further, CO concentrations would not be expected to exceed the NAAQS, and no additional modeling would be required.

Appendix F4.9

Stormwater Management for East Link Project

The approach to stormwater management proposed within each segment of the East Link Project is summarized below. The numbers of water quality and detention vaults and the surface areas of detention ponds and constructed stormwater wetlands are shown in Table F4.9-3 for each segment. The size and locations of these facilities will change as more detailed engineering is performed in future project phases. There is the potential for contribution to regional detention and treatment facilities, where available or appropriate, as an alternative to onsite detention or treatment systems, via vaults or ponds.

F4.9.1 Segment A

Segment A (see Exhibit 4.9-1 in Section 4.9 of the Final Environmental Impact Statement [EIS]) passes through the Cities of Seattle and Mercer Island and stays within the Washington State Department of Transportation (WSDOT) right-of-way along Interstate 90 (I-90) for the entire length of the segment. An existing highway drainage system serves the entire segment. A small amount of the D2 Roadway in the western portion of this segment would be reconstructed; therefore, a single detention vault is proposed at this location. Because this area drains to Seattle's combined sewer, no stormwater treatment would be required. No detention or water quality treatment facilities would be required for the remainder of this segment because the project would create little or no new or reconstructed pavement areas.

F4.9.2 Segment B

Segment B (see Exhibit 4.9-2 in Section 4.9 of the Final EIS) falls within the City of Bellevue. The City of Bellevue has a fully separated stormwater system that drains to local streams, Mercer Slough, or Lake Washington. The runoff from large portions of Segment B alternatives could be routed directly to Mercer Slough, a detention-exempt water body, and would therefore require no detention. Detention would be required for the northern portion of Segment B, however. Note that the Bellevue Way Alternative (B1) is isolated from Mercer Slough, and this alternative would require seven vaults to provide the required detention. A small constructed wetland would provide treatment to runoff from the reconstructed South Bellevue Park-and-Ride.

F4.9.3 Segment C

Segment C (see Exhibit 4.9-3 in Section 4.9 of the Final EIS) also falls within the City of Bellevue. Most of this segment lies within the Sturtevant Creek Basin that drains much of Downtown Bellevue. Sturtevant Creek Basin is an urbanized basin with greater than 40 percent impervious area. Projects occurring within this basin are subject to a lower detention requirement. Project stormwater need only be detained to meet existing (rather than forested) conditions (Volume II, Section 2.5.7 of Ecology's 2005 *Stormwater Management Manual for Western Washington*). As a result, fewer project detention vaults are required in this basin, compared to much of the rest of the study area.

Portions of the western alternatives (Bellevue Way Tunnel [C1T], 106th NE Tunnel [C2T], 108th NE Tunnel [C3T], 114th NE Elevated [C14E] and the west leg of the Couplet [C4A]) Alternative lie within the Downtown Bellevue stormwater service area. Runoff collected in this service area is conveyed directly to Lake Washington (a water body exempt from detention requirements) and would therefore not require detention. However, treatment facilities would be required to treat runoff from pollution-generating impervious surfaces (PGISs).

This is the only segment with tunnel alternatives. The portions of the tunnel alternatives that would not disturb the overlying surface or that would be constructed with a landscaped surface cover would not require stormwater facilities. In general, the tunnel and the elevated alternatives would require fewer detention vaults than the at-grade alternative.

F4.9.4 Segment D

Segment D (see Exhibit 4.9-4 in Section 4.9 of the Final EIS) passes through the cities of Bellevue and

Redmond. The area drains to several small tributaries to Kelsey Creek: West Tributary Kelsey Creek, Goff Creek, and Sears Creek. There would be considerably more detention and water quality treatment facilities in this segment compared with the other segments because there are no detention-exempt receiving waters. The NE 20th Alternative (D3) would require the largest number of detention vaults (16) in this segment.

A portion of the elevated route of the State Route (SR) 520 Alternative (D5) runs along an open, vegetated area paralleling the south side of SR 520. This situation provides the opportunity for route runoff to be dispersed beneath the guideway, eliminating the need for stormwater facilities. A similar stretch of elevated rail using this dispersal technique was constructed for the Central Link in Tukwila.

A constructed wetland would provide treatment for runoff from the maintenance facility. In addition, a small constructed wetland and a wetpond would be constructed to provide stormwater management at the Overlake Transit Center.

F4.9.5 Segment E

Segment E (see Exhibit 4.9-5 in Section 4.9 of the Final EIS) lies within the City of Redmond. Nearly all of the runoff from the southern portion of Segment E would be routed directly to the Sammamish River (a water body exempt from detention requirements) and would therefore not require detention. Project runoff within downtown Redmond lies within the city's downtown stormwater service area which also conveys collected stormwater directly to the Sammamish River. Stormwater treatment, prior to river discharge, is also provided within this stormwater service area. Therefore, the portions of the project that lie within the downtown stormwater service area would not be required to provide either detention or treatment.

A portion of the *Preferred Marymoor Alternative (E2)* is proposed to be constructed along the south shoulder of SR 520. Plans for expanding of this highway call for converting of this shoulder to an ecology embankment that would be used to infiltrate and treat highway runoff. The highway expansion would likely be completed before the East Link Project and would reduce the area available for the construction of *Preferred Alternative E2*. To accommodate the highway requirements, if E2 is selected, Sound Transit proposes to reconstruct the highway shoulder to a more compact median application of the ecology embankment that would provide the required treatment of highway runoff using less land area. An underdrain would be installed to collect infiltrated highway runoff.

In the eastern portion of Segment E, a park-and-ride lot and a maintenance facility are proposed. This area has permeable soils and an onsite constructed wetland and infiltration pond could be used for runoff. This area lies within the Redmond Wellhead Protection Area, and infiltration of stormwater would require special measures so that groundwater quality would be not affected.

TABLE F4.9-3
Number of Vaults and Wetland/Pond Surface Area

Segments	Alternatives[a]	Small Detention and Water Quality Vaults (Quantity) [b]	Medium Detention and Water Quality Vaults (Quantity)[c]	Large Detention and Water Quality Vaults (Quantity)[d]	Constructed Wetland Water Surface Area (acres)	Detention Pond Water Surface Area (acres)

[a] Italics indicates the identified preferred alternative(s) for each segment.

[b] A "small" vault has a storage capacity less than 0.6 acre-feet.

[c] A "medium" vault has a storage capacity between 0.6 and 1.4 acre-feet

[d] A "large" vault has a storage capacity greater than 1.4 acre-feet.

[e] The C9T - East Main Station Design Option connecting from *Preferred Alternative B2M* would not result in a change to the impacts for either *Preferred Alternative C9T* or *B2M*.

Appendix F4.11

Geologic Unit Summaries, Hazard Areas, and Boring Locations

Appendix F4.11

Geologic Unit Summaries, Hazard Areas, and Boring Locations

TABLE F4.11-1
Summary of Geologic Units and their Engineering Properties

Geologic Unit (Map Symbol)	Description	General Constructability	Density and/or Hardness	Strength	Permeability	Liquefaction Potential [a]
Modified land (m) [b] or ▨ or ▨	Fill and/or graded natural deposits that obscure or alter the original deposit	Varying, depending on whether nonengineered or engineered; poor foundation support and potentially poor cut stability if nonengineered, depending on composition and density and/or hardness of material; excellent foundation support and cut stability if engineered	Very soft to stiff or very loose to dense	Potentially low	Variable	Potentially high
Mass wastage (Qmw) or ∷∷	Colluvium, soil, landslide debris, and organic matter; common below springs where peaty deposits are also present; mapped on steep slopes; deposits, both mapped and unmapped, include abundant landslides up to 500 feet long	Poor foundation support, poor cut stability	Loose to dense and soft to stiff; variable degree of consolidation, depending on material in colluvium and its coherency	Potentially low	Variable	Potentially high
Landslide (Qls) ▪ ▪	Blocks of surficial deposits transported downslope en masse by gravity; numerous unmapped areas of both landslide and related mass-wastage deposits occur along slopes; landslide terrain, often including benches that slope back into the hillside and have wetlands and peat deposits	Poor foundation support, poor cut stability, potential for additional slide movement	Very loose to very dense or soft to hard; variable degree of consolidation, depending on material coherency	Potentially low	Variable	Potentially high
Wetland deposits (Qw)	Organic-rich sediment, peat, and fine-grained alluvium, poorly drained and intermittently wet; not all deposits mapped	Poor foundation support, poor cut stability, high occurrence of groundwater, wet-weather sensitive, poor soils for reuse as engineered fill due to wet conditions and a high fines and organic content	Very soft to medium stiff or very loose to medium dense	Potentially low	Variable	Potentially high
Tideflat deposits (Qtf)	Silt, sand, organic sediment, and detritus, with some shells, historically exposed in broad coastal benches at low tide and now covered with fill	Poor foundation support, poor cut stability, high occurrence of groundwater, wet-weather sensitive, poor soils to reuse as engineered fill due to wet conditions and generally a high fines content	Very loose to dense or very soft to stiff	Potentially low	Variable	Potentially high

TABLE F4.11-1 CONTINUED
Summary of Geologic Units and their Engineering Properties

Geologic Unit (Map Symbol)	Description	General Constructability	Density and/or Hardness	Strength	Permeability	Liquefaction Potential [a]
Younger alluvium (Qyal)	Silt, sand, gravel, and cobbles deposited by streams and running water; locally contains soft peat lenses	Poor to good foundation support, depending on composition, density and/or hardness, and construction type; some soils might be wet-weather sensitive; some soils might be suitable for reuse as engineered fill, depending on amount of fines content; poor where peat materials occur	Loose to dense or soft to stiff	Low to medium	Variable	Potentially high
Lake deposits (Ql)	Silt and clay with local sand layers, peat, and other organic sediments deposited into Lake Washington; most mapped areas are lake-bottom sediments exposed when Lake Washington was lowered in 1916; at many locations, the lake deposits are thin and overlie a dense substrate; commonly capped by fill to improve building sites	Poor foundation support; poor cut stability; high groundwater occurrence; wet-weather sensitive; poor soils for reuse as engineered fill due to wet conditions and a high fines content	Very soft to medium stiff or very loose to medium dense	Potentially low	Low	Potentially high
Vashon recessional outwash deposits (Qvr)	Layered sand and gravel, deposited in outwash channels of melting glaciers during the ice retreat; also includes deposits that accumulated in or adjacent to recessional lakes; deposits less than about 3 feet thick not shown on map	Good foundation support and cut stability when undisturbed; potential groundwater occurrence; soils suitable for reuse as engineered fill	Loose to dense	Low to medium	Medium	Potentially high
Vashon recessional lacustrine deposits (Qvrl)	Thinly layered silt and clay with local sand layers, peat, and other organic sediments, deposited in slow-flowing water and temporary lakes	Poor to good foundation support and cut stability, depending on composition, density and/or hardness, and construction type; wet-weather sensitive; poor soils for reuse as engineered fill due to high fines content	Very soft to stiff	Medium	Low	Low to medium
Vashon till (Qvt)	Compact mixture of silt, sand, and gravel, glacially transported and deposited under ice; contains layers of sand and gravel; cobbles are common; upper 3 feet of till generally weathered and only medium dense to dense	Excellent foundation support and stable cuts when undisturbed; low groundwater occurrence; wet-weather sensitive; soils suitable for reuse as engineered fill depending on moisture content	Dense to very dense; sand commonly less dense	High	Low	Low
Vashon advance outwash (Qva)	Sand and gravel deposited by streams from advancing ice sheet; silt lenses locally present in upper part and common in lower part	Excellent foundation support and stable cuts when undisturbed, unless below the water table or exposed to water; potentially high groundwater occurrence; soils suitable for reuse as engineered fill	Dense to very dense	High[c]	High	Low

Appendix F5

Reasonably Foreseeable Future Actions in Study Area

TABLE F5-1
Reasonably Foreseeable Future Actions in Study Area

Name of Project (Sponsor)	Description	Expected Start Date or Status	Identified Environmental Impacts
WSDOT			
I-90 Two-Way Transit and HOV Operations (WSDOT and Sound Transit)	The project will provide full-time HOV lanes for eastbound and westbound traffic on the outer I-90 roadways and will retain the existing reversible lane operations in the center roadway (implementation of Alternative R-8A).	Stage 1: complete Stage 2: under construction (2010 through 2012) Stage 3; design (2008 through 2011), construction (2012 through 2014)	Hazardous materials, construction impacts, water resources
SR 520 Bridge Replacement and HOV Project (WSDOT)	This project will improve access and mobility from Seattle to Redmond.	Environmental documentation underway 2011 construction start	Parks, historic resources, Section 4(f), water resources, wetlands, fisheries, wildlife hazardous materials, visual
I-405 NE 8th Street to SR 520 Braided Crossing (WSDOT)	This project will construct new structures to separate northbound traffic exiting to SR 520 from traffic entering I-405 in Bellevue. The project also adds a new eastbound collector distributor lane along SR 520 to separate the on- and off-ramps between I-405 and 124th Avenue NE traffic and a new on ramp at NE 10th Street to SR 520.	Under construction	None after mitigation
Sound Transit			
ST2	Extends Link light rail to the north, south, and east and increases Express Regional bus service and Sounder commuter rail service.	Ongoing, commenced in 2009	Project specific impacts to be determined
City of Mercer Island			
Town Center District Plan	This project supports the development of the Town Center District as the primary urban center for Mercer Island.	Currently being implemented	Minor impacts related to redevelopment of existing urban property
Mercer Island Private Development Projects			
Aviara	2441 76th Avenue SE; 14,100 square feet commercial 165 units	In review	Discussed under Town Center District Plan
City of Bellevue			
Downtown Implementation and Subarea Plan	This project supports the development of downtown Bellevue as the primary urban center of the Eastside; for related development,	Document completed 2006, to be implemented	Hazardous materials, right-of-way, utilities, wetlands, wildlife, and visual
Bel-Red Corridor Project	The proposed action is the adoption of amendments to various city planning documents to designate new land uses and identify supporting transportation improvements for redevelopment of the Bel-Red Corridor.	Plan adopted February 2009	Hazardous materials, right-of-way, public services, utilities, visual, and construction
Surrey Downs Park Master Plan	Will redesign Surrey Downs Park to better serve the neighborhood. The master plan will represent a long-term vision for the park, guiding redevelopment by identifying opportunities and constraints	Environmental review process complete, SEPA Determination of Non-significance issued January 2009, Master Plan adopted March 2009	Visual, construction, utilities

TABLE F5-1 CONTINUED

North Mercer-Enatai Interceptors	Planning Phase	2012 – 2030	To be determined
Brightwater Reclaimed Water Pipeline	Regional Wastewater Treatment Plant	Under construction	Water resources, geology, wetlands, parks, energy, construction

[a] Expected start dates for Bellevue private development projects (excluding the Spring District) sources include Downtown Bellevue Major Project List (3rd quarter 2009 and 4th quarter 2010) and Downtown Bellevue Development Pipeline: 2007-2013. The Spring District start date is unknown at this time.

Table of Contents

Legend

Segment A:

Preferred Alternative A1: Sheets A1-A28

Segment B:

Eastbound HOV Direct Access Ramp Reconstruction (Necessary for Alternatives B2M, B2A, B2E, B3 and B7): B1
Preferred Alternative B2M (including stations): B2-B25
Alternative B1: B26-B35
Alternative B2A: B36-B50
Alternative B2E: B51-B60
Alternative B3 (including 114th Extension Design Option): B61-B71
Alternative B7: B72-B81
South Bellevue Station (Non-Preferred Alternatives): B82-B85
SE 8th Station (Non-Preferred Alternatives): B86-B91
118th Station: B92-B93

Segment C:

Preferred Alternative C11A (including stations): C1-C18
Preferred Alternative C9T (including East Main Station Design Option and stations): C19-C36
Alternative C1T: C37-C46
Alternative C2T: C47-C66
Alternative C3T: C67-C86
Alternative C4A: C87-C109
Alternative C7E: C110-C121
Alternative C8E: C122-C131
Old Bellevue Station: C132-C133
East Main Station (Non-Preferred Alternatives): C134- C139
Bellevue Transit Center Station (Non-Preferred Alternatives): C140-153
Hospital Station (Non-Preferred Alternatives): C154- C155
Ashwood/Hospital Station (Non-Preferred Alternatives): C156-163
Alternative C9A: C164-C180
Alternative C14E: C181-C190

Segment D:

Preferred Alternative D2A (including design options and stations): D1- D34
Alternative D2E: D35-D47
Alternative D3: D48-D60
Alternative D5: D61-D75
120th Station (Non-Preferred Alternatives): D76-D79
130th Station (Non-Preferred Alternatives): D80-D83
Overlake Village Station (Non-Preferred Alternatives): D84- D91
Overlake Transit Center Station (Non-Preferred Alternatives): D92-D93
Maintenance Facilities 1, 2 and 4: D94-D100

Segment E:

Preferred Alternative E2 (including Redmond Transit Center Design Option and stations): E1- E27
Alternative E1: E28-E45
Alternative E: E46-E60
Redmond Town Center Station: E61-E62
Maintenance Facility 5: E63-E65

NOTES

1. ARROWS INDICATE TRUCK HAUL ROUTES TO BE USED DURING CONSTRUCTION.
2. THE CONTRACTOR SHALL MAINTAIN PEDESTRIAN, BICYCLE, AND LOCAL ACCESS AT ALL TIMES.
3. HEAVY CONSTRUCTION TRAFFIC SHALL USE I-90, I-405, OR SR 520 TO AND FROM CONSTRUCTION SITE.
4. THE CONTRACTOR SHALL BE AWARE OF ALL POTENTIAL CONFLICTS BETWEEN HAUL TRUCK OPERATIONS AND EXISTING CATENARY WIRE SYSTEMS ALONG THE PROPOSED TRUCK ROUTE.
5. THE CONTRACTOR SHALL OBTAIN ALL NECESSARY HAULING PERMITS FROM STATE AND LOCAL AGENCIES.
6. SEE SPECIAL PROVISIONS AND SPECIFICATIONS FOR ADDITIONAL TRAFFIC CONTROL REQUIREMENTS.

NOTES

1. ARROWS INDICATE TRUCK HAUL ROUTES TO BE USED DURING CONSTRUCTION.
2. THE CONTRACTOR SHALL MAINTAIN PEDESTRIAN, BICYCLE, AND LOCAL ACCESS AT ALL TIMES.
3. HEAVY CONSTRUCTION TRAFFIC SHALL USE I-90, I-405, OR SR 520 TO AND FROM CONSTRUCTION SITE.
4. THE CONTRACTOR SHALL BE AWARE OF ALL POTENTIAL CONFLICTS BETWEEN HAUL TRUCK OPERATIONS AND EXISTING CATENARY WIRE SYSTEMS ALONG THE PROPOSED TRUCK ROUTE.
5. THE CONTRACTOR SHALL OBTAIN ALL NECESSARY HAULING PERMITS FROM STATE AND LOCAL AGENCIES.
6. SEE SPECIAL PROVISIONS AND SPECIFICATIONS FOR ADDITIONAL TRAFFIC CONTROL REQUIREMENTS.
